

Spartan Controls Environmental Team Charter

“Spartan Controls is committed to environmental leadership within our community, our business operations and the industries we serve through education and the application of best practices and technology.”

Don Cawley - VP Automation Solutions / Environmental Team Executive Sponsor

The Spartan Controls Environmental Team is focused on three key areas – our customers, our business operations and our fellow Spartans.

Spartan is continually researching applications in which our products can provide a measureable and substantial environmental benefit to our customers. These findings are communicated to our customers via environmentally focused application notes and information sessions. Spartan also tracks the quantifiable environmental value that we deliver to our customers via a proprietary in-house database. This database allows us to summarize the environmental value that our products are delivering, and to report that value to our customers.

Spartan is also committed to adaptively managing our day-to-day business operations in an environmentally responsible fashion, and is committed to improving that performance over time. In 2009, Spartan began tracking various metrics related to consumable items such as water usage, electricity usage, paper usage and other larger scale metrics including waste generation and CO₂ emissions from our company vehicles. These metrics have been used to set reduction targets to challenge ourselves to improve our environmental performance. In addition, Spartan has ensured that our facilities operate in accordance with the BOMA BEST environmental certification program.

Finally, Spartan actively encourages our fellow employees, or “Spartans,” to participate in environmentally responsible activities at home and in our communities. This is accomplished by engaging our fellow Spartans in environmentally focused dialogues and by providing venues for green education in the workplace. By keeping the environment at the forefront of our Spartans’ minds, both in our homes and in the workplace, we can ensure that we as individuals are doing our part to be environmentally responsible.
