

Optimize Logistics with Wheelhouse

In today's complex bulk commodity supply chains, fragmented data is more than an inconvenience - it's a critical business liability. When terminal, rail, and trucking information exists in separate systems, your decision-making slows dramatically, creating costly ripple effects throughout your organization.

Siloed Data

Terminal, inventory, and transactional data trapped in disconnected systems, limiting visibility for production accountants, commercial teams, and logistics planners.

Manual Document Sharing

BOLs and tickets shared manually via email and fax, creating delays, errors, and missed opportunities for real-time decision making.

Integration Blockades

Limited connections between logistics and enterprise applications hampering critical business functions in finance, logistics planning, and commercial operations.

Performance Impacts

Inefficient riser utilization, congestion at terminals and operational bottlenecks caused by fragmented information flow across your supply chain.

Wheelhouse by VantEdge offers a unified cloud platform that connects every movement, nomination and inventory signal across your operations. By integrating data from Terminal Management Systems, and even PDF BOLs, operators typically reduce logistics administration by 30% while significantly improving on-time performance.

Terminal Sync

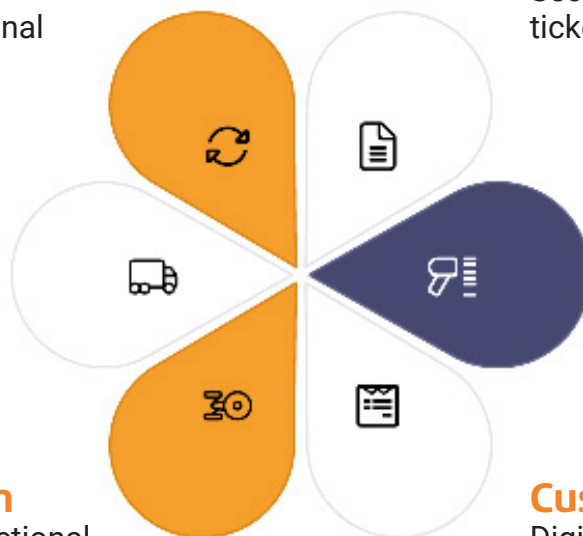

Integrate transactional and inventory data from all terminal management systems

Truck Scheduling

Manage congestion and wait fees using the comprehensive scheduling and communication app

Enterprise Integration

Seamlessly integrate transactional, inventory, and contract information to FDCs, ERPs, and ETRMs

Partner Portal

Secure self-serve ticket and BOL/ ticket exchange with counter parties

AI BOL Scanner

Turn PDF BOLs/tickets into structured transactions

Custom Forms

Digitally capture ticketers at non-automated loading/unloading sites
