Rosemount 3051 Pressure Transmitter and
Rosemount 3051CF Series Flowmeters
with FOUNDATION™ fieldbus protocol

Note
Before installing the transmitter, confirm the correct device driver is loaded on the host systems.
See “System readiness” on page 3.
NOTICE

This guide provides basic guidelines for Rosemount 3051 Transmitters. It does not provide instructions for configuration, diagnostics, maintenance, service, troubleshooting, Explosion-Proof, Flame-Proof, or intrinsically safe (I.S.) installations. Refer to the Rosemount 3051 Reference Manual (document number 00809-0100-4774) for more instruction. This manual is also available electronically on www.rosemount.com.

WARNING

Explosions could result in death or serious injury.

Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the approvals section of the 3051 reference manual for any restrictions associated with a safe installation.

- In an Explosion-proof/Flameproof installation, do not remove the transmitter covers when power is applied to the unit.

Process leaks may cause harm or result in death.

- To avoid process leaks, only use the O-ring designed to seal with the corresponding flange adapter.

Electrical shock can result in death or serious injury.

- Avoid contact with the leads and the terminals. High voltage that may be present on leads can cause electrical shock.

Conduit/cable entries

- Unless marked, the conduit/cable entries in the transmitter housing use a 1/2-14 NPT thread form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

Confirm correct device driver

- Verify the correct device driver (DD/DTM™) is loaded on your systems to ensure proper communications.
- Download the correct device driver at your host vendor download site, www.emersonprocess.com or www.fieldbus.org.

Rosemount 3051 device revisions and drivers

Table 1 provides the information necessary to ensure you have the correct device driver and documentation for your device.

</table>

1. FOUNDATION fieldbus device revision can be read using a FOUNDATION fieldbus capable configuration tool.
2. Device driver file names use device and DD revision. To access functionality, the correct device driver must be installed on your control and asset management hosts, and on your configuration tools.

Figure 1. Installation Flowchart
Transmitter installation

Step 1: Mount the transmitter

Liquid applications

1. Place taps to the side of the line.
2. Mount beside or below the taps.
3. Mount the transmitter so that the drain/vent valves are oriented upward.

Gas applications

1. Place taps in the top or side of the line.
2. Mount beside or above the taps.

Steam applications

1. Place taps to the side of the line.
2. Mount beside or below the taps.
3. Fill impulse lines with water.
Figure 2. Panel and Pipe Mounting

Panel mount(1)

Pipe mount

Coplanar flange

Traditional flange

Rosemount 3051T

1. 5/16 x 17/2 Panel Bolts are customer supplied.
Bolting considerations

If the transmitter installation requires assembly of the process flanges, manifolds, or flange adapters, follow the assembly guidelines to ensure a tight seal for optimal performance characteristics of the transmitters. Use only bolts supplied with the transmitter or sold by Emerson as spare parts. Figure 3 on page 6 illustrates common transmitter assemblies with the bolt length required for proper transmitter assembly.

**Figure 3. Common Transmitter Assemblies**

A. Transmitter with coplanar flange
B. Transmitter with coplanar flange and optional flange adapters
C. Transmitter with traditional flange and optional flange adapters
D. Transmitter with coplanar flange and optional manifold and flange adapters

Bolts are typically carbon steel or stainless steel. Confirm the material by viewing the markings on the head of the bolt and referencing Table 2 on page 7. If bolt material is not shown in Table 2, contact a local Emerson Process Management representative for more information.

Carbon steel bolts do not require lubrication and the stainless steel bolts are coated with a lubricant to ease installation. However, no additional lubricant should be applied when installing either type of bolt.

Use the following bolt installation procedure:

1. Finger tighten the bolts.
2. Torque the bolts to the initial torque value using a crossing pattern. See Table 2 for initial torque value.
3. Torque the bolts to the final torque value using the same crossing pattern. See Table 2 for final torque value.
4. Verify the flange bolts are protruding through the sensor module bolt holes before applying pressure.

O-rings with flange adapters

**WARNING**

Failure to install proper flange adapter O-rings may cause process leaks, which can result in death or serious injury. The two flange adapters are distinguished by unique O-ring grooves. Only use the O-ring that is designed for its specific flange adapter, as shown below.

Rosemount 3051S / 3051 / 2051 / 3001 / 3095

Whenever the flanges or adapters are removed, visually inspect the O-rings. Replace them if there are any signs of damage, such as nicks or cuts. If you replace the O-rings, re-torque the flange bolts and alignment screws after installation to compensate for seating of the PTFE O-ring.
In-line gage transmitter orientation

The low side pressure port (atmospheric reference) on the in-line gage transmitter is located in the neck of the transmitter, behind the housing. The vent path is 360° around the transmitter between the housing and sensor. (See Figure 4.)

Keep the vent path free of any obstruction, including but not limited to paint, dust, and lubrication by mounting the transmitter so that fluids can drain away.

Figure 4. In-line Gage Low Side Pressure Port

A. Pressure port location
Step 2: Tagging

Commissioning (paper) tag

To identify which device is at a particular location use the removable tag provided with the transmitter. Ensure the physical device tag (PD Tag field) is properly entered in both places on the removable commissioning tag and tear off the bottom portion for each transmitter.

Note
The device description loaded in the host system must be at the same revision as this device, see “System readiness” on page 3.

Figure 5. Commissioning Tag

Note
The device description loaded in the host system must be at the same revision as this device. The device description can be downloaded from the host system website or www.rosemount.com by selecting Download Device Drivers under Product Quick Links. You can also visit www.fieldbus.org and select End User Resources.
Step 3: Housing rotation

To improve field access to wiring or to better view the optional LCD display:

1. Loosen the housing rotation set screw using a $\frac{3}{64}$-in. hex wrench.
2. Rotate the housing clockwise to the desired location.
3. If the desired location cannot be achieved due to thread limit, rotate the housing counterclockwise to the desired location (up to 360° from thread limit).
4. Retighten the housing rotation set screw to no more than 7 in.-lfs when desired location is reached.

Figure 6. Housing Rotation

A. Housing rotation set screw ($\frac{3}{64}$-in.)
Step 4: Set the switches

Set Simulate and Security switch configuration before installation as shown in Figure 7.

- The simulate switch enables or disables simulated alerts and simulated AI Block status and values. The default simulate switch position is enabled.
- The Security switch allows (unlocked symbol) or prevents (locked symbol) any configuration of the transmitter.
  - Default security is off (unlocked symbol).
  - The security switch can be enabled or disabled in software.

Use the following procedure to change the switch configuration:
1. If the transmitter is installed, secure the loop, and remove power.
2. Remove the housing cover opposite the field terminal side. Do not remove the instrument cover in explosive atmospheres when the circuit is live.
3. Slide the security and simulate switches into the preferred position.
4. Replace the housing cover.

Note
It is recommended the cover be tightened until there is no gap between the cover and the housing.

Figure 7. Simulate and Security Switches

A. Simulate disabled position
B. Simulate switch
C. Simulate enabled position (default)
D. Security locked position
E. Security switch
F. Security unlocked position (default)
Step 5: Wire, ground, and power up

Use of copper wire of sufficient size to ensure that the voltage across the transmitter power terminals does not drop below 9 vdc. Power supply voltage can be variable, especially under abnormal conditions such as when operating on battery backup. A minimum of 12 vdc under normal operating conditions is recommended. Shielded twisted pair Type A cable is recommended.

1. To power the transmitter, connect the power leads to the terminals indicated on the terminal block label.

Figure 8. Wiring Terminals

Note
The 3051 power terminals are polarity insensitive, which means the electrical polarity of the power leads does not matter when connecting to the power terminals. If polarity sensitive devices are connected to the segment, terminal polarity should be followed. When wiring to the screw terminals, the use of crimped legs is recommended.

2. Tighten the terminal screws to ensure adequate contact. No additional power is needed.
Signal wiring grounding

Do not run signal wiring in conduit or open trays with power wiring, or near heavy electrical equipment. Grounding terminations are provided on the outside of the electronics housing and inside the Terminal Compartment. These grounds are used when transient protect terminal blocks are installed or to fulfill local regulations.

1. Remove the Field Terminals housing cover.
2. Connect the wiring pair and ground as indicated in Figure 8.
   a. Trim the cable shield as short as practical and insulate from touching the transmitter housing.

**Note**
Do NOT ground the cable shield at the transmitter; if the cable shield touches the transmitter housing, it can create ground loops and interfere with communications.

b. Continuously connect the cable shields to the power supply ground.
c. Connect the cable shields for the entire segment to a single good earth ground at the power supply.

**Note**
Improper grounding is the most frequent cause of poor segment communications.

3. Replace the housing cover. It is recommended that the cover be tightened until there is no gap between the cover and the housing.
4. Plug and seal unused conduit connections.

Power supply

The transmitter requires between 9 and 32 V dc (9 and 30 V dc for intrinsic safety, and 9 and 17.5 V dc for FISCO intrinsic safety) to operate and provide complete functionality.

Power conditioner

A fieldbus segment requires a power conditioner to isolate the power supply, filter, and decouple the segment from other segments attached to the same power supply.

Grounding

Signal wiring of the fieldbus segment can not be grounded. Grounding out one of the signal wires will shut down the entire fieldbus segment.

Shield wire ground

To protect the fieldbus segment from noise, grounding techniques for shield wire require a single grounding point for shield wire to avoid creating a ground loop. Connect the cable shields for the entire segment to a single good earth ground at the power supply.
Signal termination

For every fieldbus segment a terminator should be installed at the beginning and at the end of each segment.

Locating devices

Devices are frequently installed, configured, and commissioned over time by different personnel. A “Locate Device” capability uses the LCD display (when installed) to assist personnel in finding the desired device.

From the device Overview screen, select the Locate Device button. This will launch a method allowing the user to display a “Find me” message or enter a custom message to display on the device LCD display.

When the user exits the “Locate Device” method, the device LCD display automatically returns to normal operation.

Note

Some hosts do not support “Locate Device” in the DD.
Step 6: Configure

Each FOUNDATION fieldbus host or configuration tool has a different way of displaying and performing configurations. Some use Device Descriptions (DD) or DD methods for configuration and to display data consistently across platforms. There is no requirement that a host or configuration tool support these features. Use the following block examples to do basic configuration to the transmitter. For more advanced configurations see the 3051 Reference Manual (document number 00809-0100-4774, Rev. CA or newer).

**Note**
DeltaV™ users should use DeltaV Explorer for the Resource and Transducer blocks and Control Studio for the Function Blocks.

Configure the AI block

Navigation instructions for each step are provided below. In addition the screens used for each step are shown in Figure 10, Basic Configuration Menu Tree.

**Figure 9. Configuration Flowchart**

- Start Device Configuration Here
- 1. Verify Device Tag: PD_TAG
- 2. Check Switches and Software Write Lock
- 3. Set Signal Conditioning: L_TYPE
- 4. Set Scaling XD_SCALE
- 5. Set Scaling OUT_SCALE
- 6. Set Low Cutoff: LOW_CUT
- 7. Set Damping: PRIMARY_VALUE_DAMPING
- 8. Set up LCD Display
- 9. Review Transmitter Configuration
- 10. Set Switches and Software Write Lock
- Done
Before you begin

See Figure 9 to graphically view the step by step process for basic device configuration. Before beginning configuration you may need to verify the Device Tag or deactivate hardware and software write protection on the transmitter. To do this follow Step 1 and Step 2 below. Otherwise continue at “AI block configuration” below.

1. To verify the device tag:
   a. Navigation: from the Overview screen, select Device Information to verify the device tag.
2. To check the switches (see Figure 7):
   a. The write lock switch must be in the unlocked position if the switch has been enabled in software.
   b. To disable the Software Write Lock (devices ship from the factory with the software write lock disabled):
      i. Navigation: from the Overview screen, select Device Information and then select the Security and Simulation tab.
      ii. Perform Write Lock Setup to disable Software Write Lock.

Note
Place the control loop in “Manual” mode before beginning Analog Input Block configuration.

AI block configuration
To use guided setup:
- Navigate to Configure>Guided Setup.
- Select AI Block Unit Setup.

Note
Guided setup will automatically go through each step in the proper order.

Note
For convenience, AI Block 1 is pre-linked to the transmitter primary variable and should be used for this purpose. AI Block 2 is pre-linked to the transmitter sensor temperature. The channel must be selected for AI Blocks 3 and 4.

- Channel 1 is the primary variable.
- Channel 2 is the sensor temperature.

If the FOUNDATION fieldbus Diagnostics Suite Option Code D01 is enabled, these additional channels are available.
- Channel 12 is the SPM mean.
- Channel 13 is the SPM standard deviation.

To configure SPM refer to the 3051 FOUNDATION fieldbus Reference Manual document number 00809-0100-4774.

Note
Step 3 through Step 6 are all performed in a single step by step method under guided setup, or on a single screen using manual setup.

Note
If the L_TYPE selected in Step 3 is “Direct”, Step 4, Step 5 and Step 6 are not needed. If the L_TYPE selected is “Indirect”, Step 6 is not needed. Any unneeded steps will automatically be skipped.
3. To select the Signal Conditioning “L_TYPE” from the drop down menu:
   a. Select **L_TYPE: Direct** for pressure measurements using the device default units.
   b. Select **L_TYPE: Indirect** for other pressure or level units.
   c. Select **L_TYPE: Indirect Square Root** for flow units.
4. To set XD_SCALE to the 0% and 100% scale points (the transmitter range):
   a. Select the **XD_SCALE_UNITS** from the drop down menu.
   b. Enter the **XD_SCALE 0%** point. This may be elevated or suppressed for level applications.
   c. Enter the **XD_SCALE 100%** point. This may be elevated or suppressed for level applications.
   d. If L_TYPE is “Direct”, the AI Block may be placed in **AUTO** mode to return the device to service. Guided Setup does this automatically.
5. If L_TYPE is “Indirect” or “Indirect Square Root”, set **OUT_SCALE** to change engineering units.
   a. Select the **OUT_SCALE UNITS** from the drop down menu.
   b. Set the **OUT_SCALE** low value. This may be elevated or suppressed for level applications.
   c. Set the **OUT_SCALE** high value. This may be elevated or suppressed for level applications.
   d. If L_TYPE is “Indirect”, the AI Block may be placed in **AUTO** mode to return the device to service. Guided Setup does this automatically.
6. If L_TYPE is “Indirect Square Root”, a **LOW FLOW CUTOFF** function is available.
   a. Enable **LOW FLOW CUTOFF**.
   b. Set the **LOW_CUT VALUE** in **XD_SCALE UNITS**.
   c. The AI Block may be placed in **AUTO** mode to return the device to service. Guided Setup does this automatically.
7. Change damping.
   a. To use guided setup:
      - Navigate to **Configure>Guided Setup**.
      - Select **Change Damping**.
   b. To use manual setup:
      - Navigate to **Configure>Manual Setup>Process Variable**.
      - Select **Change Damping**.
      - Enter the desired damping value in seconds. The permitted range of values is 0.4 to 60 seconds.

---

**Note**

Guided Setup will automatically go through each step in the proper order.

- Enter the desired damping value in seconds. The permitted range of values is 0.4 to 60 seconds.
- To use manual setup:
  - Navigate to **Configure>Manual Setup>Process Variable**.
  - Select **Change Damping**.
  - Enter the desired damping value in seconds. The permitted range of values is 0.4 to 60 seconds.
8. Configure optional LCD display (if installed).
   a. To use guided setup:
      ■ Navigate to Configure>Guided Setup.
      ■ Select Local Display Setup.
   
   **Note**
   Guided setup will automatically go through each step in the proper order.

   ■ Check the box next to each parameter to be displayed to a maximum of four parameters. The LCD display will continuously scroll through the selected parameters.
   b. To use manual setup:
      ■ Navigate to Configure>Guided Setup.
      ■ Select Local Display Setup.
      ■ Check each parameter to be displayed. The LCD display will continuously scroll through the selected parameters.

9. Review transmitter configuration and place in service.
   a. To review the transmitter configuration navigate using the manual setup navigation sequences for "AI Block Unit Setup", "Change Damping", and "Set up LCD Display".
   b. Change any values as necessary.
   c. Return to the Overview screen.
   d. If Mode is “Not in Service”, click on the Change button, and then click on Return All to Service.

   **Note**
   If hardware or software write protection is not needed, Step 10 can be skipped.

10. Set switches and software write lock.
    a. Check switches (see Figure 7).

    **Note**
    The write lock switch can be left in the locked or unlocked position. The simulate enable/disable switch may be in either position for normal device operation.

    **Enable software write lock**
    1. Navigate from the Overview screen.
       a. Select Device Information.
       b. Select the Security and Simulation tab.
    2. Perform Write Lock Setup to enable Software Write Lock.

Display pressure on the LCD display
Select the **Pressure** check box on the display configuration screen.

Step 7: Zero trim the transmitter

**Note**
Transmitters are shipped fully calibrated per request or by the factory default of full scale (span = upper range limit).

A zero trim is a single-point adjustment used for compensating mounting position and line pressure effects. When performing a zero trim, ensure that the equalizing valve is open and all wet legs are filled to the correct level. The transmitter will only allow 3-5% URL Zero error to be trimmed. For greater zero errors, compensate for the offset by using the XD_Scaling, Out_Scaling and Indirect L_Type which are part of the AI Block.

1. To use guided setup:
   a. Navigate to **Configure>Guided Setup**.
   b. Select **Zero Trim**.
   c. The method will execute the zero trim.

2. To use manual setup:
   a. Navigate to **Overview>Calibration>Sensor Trim**.
   b. Select **Zero Trim**.
   c. The method will execute the zero trim.
Product Certifications

European Directive Information
A copy of the EC Declaration of Conformity can be found at the end of the Quick Start Guide. The most recent revision of the EC Declaration of Conformity can be found at www.rosemount.com.

Ordinary Location Certification
As standard, the transmitter has been examined and tested to determine that the design meets the basic electrical, mechanical, and fire protection requirements by a nationally recognized test laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

North America

**E5** USA Explosionproof (XP) and Dust-Ignitionproof (DIP)
Certificate: 0T2H0.AE

**Special Conditions for Safe Use (X):**

1. This device contains a thin wall diaphragm. Installation, maintenance and use shall take into account the environmental conditions to which the diaphragm will be subjected. The manufacturer’s instructions for installation and maintenance shall be followed in detail to assure safety during its expected lifetime.

2. For information on the dimensions of the flameproof joints the manufacturer shall be contacted.

3. The capacitance of the wrap around label, being 1.6 nF, exceed the limit in Table 9 of EN60079-0. The user shall determine suitability for the specific application.

4. Some variants of the equipment have reduced markings on the nameplate. Refer to the Certificate for full equipment marking.

China

E3 China Flameproof
Certificate: GY14.1041X; GY10.1313X [Flowmeters]
Markings: Ex d IIC T6/T5, T6(-50 °C ≤ T_a ≤ +65 °C), T5(-50 °C ≤ T_a ≤ +80 °C)

Special Conditions for Safe Use (X):
1. The relation between ambient temperature range and temperature class is as follows:

<table>
<thead>
<tr>
<th>T_a (°C)</th>
<th>Temperature class</th>
</tr>
</thead>
<tbody>
<tr>
<td>-50 °C ~ +80 °C</td>
<td>T5</td>
</tr>
<tr>
<td>-50 °C ~ +65 °C</td>
<td>T6</td>
</tr>
</tbody>
</table>

When used in a combustible dust environment, the maximum ambient temperature is 80 °C.
2. The earth connection facility in the enclosure should be connected reliably.
3. Cable entry certified by notified body with type of protection Ex d IIC in accordance with GB3836.1-2000 and GB3836.2-2000, should be applied when installed in a hazardous location. When used in combustible dust environment, cable entry in accordance with IP66 or higher level should be applied.
4. Obey the warning “Keep tight when the circuit is alive.”
5. End users are not permitted to change any internal components.

<td>0 mH</td>
<td></td>
</tr>
</tbody>
</table>

Note 1: FISCO parameters apply to both Group IIC and IIB.
Note 2: [For Flowmeters] When 644 temperature transmitter is used, the 644
temperature transmitter should be used with Ex-certified associated apparatus
to establish explosion protection system that can be used in explosive gas
atmospheres. Wiring and terminals should comply with the instruction manual of
both 644 temperature transmitter and associated apparatus. The cables between
644 temperatures transmitter and associated apparatus should be shielded cables
(the cables must have insulated shield). The shielded cable has to be grounded
reliably in a non-hazardous area.
4. Transmitters comply with the requirements for FISCO field devices specified in
IEC60079-27:2008. For the connection of an intrinsically safe circuit in accordance
with FISCO Model, FISCO parameters are listed in the table above.
5. The product should be used with Ex-certified associated apparatus to establish
explosion protection system that can be used in explosive gas atmospheres. Wiring
and terminals should comply with the instruction manual of the product and
associated apparatus.
6. The cables between this product and associated apparatus should be shielded
cables (the cables must have insulated shield). The shielded cable has to be
grounded reliably in a non-hazardous area.
7. End users are not permitted to change any intern components but to settle the
problem in conjunction with the manufacturer to avoid damage to the product.

EC Declaration of Conformity
No: RMD 1017 Rev. 1

We,

Rosemount Inc.
8200 Market Boulevard
Chanhassen, MN 55317-9685
USA

declare under our sole responsibility that the product,

Model 3051 Pressure Transmitters

manufactured by,

Rosemount Inc.
8200 Market Boulevard
Chanhassen, MN 55317-9685
USA

to which this declaration relates, is in conformity with the provisions of the European Community Directives, including the latest amendments as shown in the attached schedule.

Assumption of conformity is based on the application of the harmonized standards and, when applicable or required, a European Community notified body certification, as shown in the attached schedule.

All Models 3051 Pressure Transmitters
- EN 61326-1:2006
- EN 61326-2-3:2006

PED Directive (97/23/EC)

Models 3051CA4; 3051CD2, 3, 4, 5; 3051HD2, 3, 4, 5; (also with P9 option)
Pressure Transmitters
- Module H Conformity Assessment
- Other Standards Used: ANSI/ISA61010-1:2004, EN60770-1:1999

All other model 3051 Pressure Transmitters
- Sound Engineering Practice

Transmitter Attachments: Diaphragm Seal - Process Flange - Manifold
- Sound Engineering Practice

Model 3051CFx Flowmeter Transmitters (All 3051CFx models are SEP except as noted in the table below)
- QS Certificate of Assessment - CE-41-PED-H1-RMT-001-04-USA
- Module H Conformity Assessment
- Evaluation standards: ASME B31.3:2010

1. FOUNDATION fieldbus device revision can be read using a FOUNDATION fieldbus capable configuration tool.
2. Device driver file names use device and DD revision. To access functionality, the correct device driver must be installed on your control and asset management hosts, and on your configuration tools.
