Section 1  Introduction

SYSTEM DESCRIPTION

The Rosemount® 8700 Series Magnetic Flowmeter System consists of a sensor and transmitter, and measures volumetric flow rate by detecting the velocity of a conductive liquid that passes through a magnetic field.

There are two Rosemount magnetic flowmeter sensors:
- Flanged Rosemount 8750WA xxxxxxxxF
- Wafer-Style Rosemount 8750WA xxxxxxxxW

There are two Rosemount magnetic flowmeter transmitters:
- Rosemount 8750WA12
- Rosemount 8750WA32

The sensor is installed in-line with process piping — either vertically or horizontally. Coils located on opposite sides of the sensor create a magnetic field. Electrodes located perpendicular to the coils make contact with the process fluid. A conductive liquid moving through the magnetic field generates a voltage at the two electrodes that is proportional to the flow velocity.

The transmitter drives the coils to generate a magnetic field, and electronically conditions the voltage detected by the electrodes to provide a flow signal. The transmitter can be integrally or remotely mounted from the sensor.

This manual is designed to assist in the installation and operation of the Rosemount 8750WA Magnetic Flowmeter.
SAFETY MESSAGES

Procedures and instructions in this manual may require special precautions to ensure the safety of the personnel performing the operations. Refer to the safety messages listed at the beginning of each section before performing any operations.

WARNING

Attempting to install and operate the Rosemount 8750WA Flowmeter system, without reviewing the instructions contained in this manual could result in personal injury or equipment damage.

SERVICE SUPPORT

To expedite the return process outside the United States, contact the nearest Emerson Process Management representative.

Within the United States and Canada, call the North American Response Center using the 800-654-RSMT (7768) toll-free number. The Response Center, available 24 hours a day, will assist you with any needed information or materials.

The center will ask for product model and serial numbers, and will provide a Return Material Authorization (RMA) number. The center will also ask for the name of the process material to which the product was last exposed.

Mishandling products exposed to a hazardous substance may result in death or serious injury. If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

The North American Response Center will detail the additional information and procedures necessary to return goods exposed to hazardous substances.

⚠️ See “Safety Messages” on page D-1 for complete warning information.
Section 2  Installation of the 8750WA12

This section covers the steps required to physically install the magnetic flowmeter. Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please refer to the following safety messages before performing any operation in this section.

SAFETY MESSAGES

⚠️ This symbol is used throughout this manual to indicate that special attention to warning information is required.

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please refer to the following safety messages before performing any operation in this section.

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury:

Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified. Verify that the operating environment of the sensor and transmitter is consistent with the appropriate hazardous area approval.

Do not connect a Rosemount 8750WA12 to a non-Rosemount sensor that is located in an explosive atmosphere.
Before installing the Rosemount 8750WA12 Magnetic Flowmeter Transmitter, there are several pre-installation steps that should be completed to make the installation process easier:

- Identify the options and configurations that apply to your application
- Set the hardware switches if necessary
- Consider mechanical, electrical, and environmental requirements

The mounting site for the Rosemount 8750WA12 transmitter should provide enough room for secure mounting, easy access to conduit ports, full opening of the transmitter covers, and easy readability of the LOI screen (see Figure 2-1). The transmitter should be mounted in a manner that prevents moisture in conduit from collecting in the transmitter.

The 8750WA12 is mounted separately from the sensor, it is not subject to limitations that might apply to the sensor.
Figure 2-1. Rosemount 8750WA Dimensional Drawing

WITH STANDARD COVER

WITH LOI COVER

NOTE
Dimensions are in inches (millimeters)
Environmental Considerations

To ensure maximum transmitter life, avoid excessive heat and vibration. Typical problem areas:

- high-vibration lines with integrally mounted transmitters
- warm-climate installations in direct sunlight
- outdoor installations in cold climates.

Remote-mounted transmitters may be installed in the control room to protect the electronics from the harsh environment and provides easy access for configuration or service.

Rosemount 8750WA12 transmitters require external power and there must be access to a suitable power source.

INSTALLATION PROCEDURES

Rosemount 8750WA12 installation includes both detailed mechanical and electrical installation procedures.

Mount the Transmitter

At a remote site the transmitter may be mounted on a pipe up to two inches in diameter or against a flat surface.

Pipe Mounting

To mount the transmitter on a pipe:

1. Attach the mounting plate to the pipe using the mounting hardware.
2. Attach the 8750WA12 to the mounting plate using the mounting screws.

Surface Mounting

To surface mount the transmitter:

1. Attach the 8750WA12 to the mounting location using the mounting screws.

Identify Options and Configurations

The standard application of the 8750WA12 includes a 4–20 mA output and control of the sensor coils. Other applications may require one or more of the following configurations or options:

- Multidrop Communications
- PZR (Positive Zero Return)
- Auxiliary Output
- Pulse Output

Additional options may apply. Be sure to identify those options and configurations that apply to your situation, and keep a list of them nearby for consideration during the installation and configuration procedures.

Hardware Switches

The 8750WA12 electronics board is equipped with three user-selectable hardware switches. These switches set the Failure Alarm Mode, Internal/External Analog Power, and Transmitter Security. The standard configuration for these switches when shipped from the factory are as follows:

- Failure Alarm Mode: HIGH
- Internal/External Analog Power: INTERNAL
- Transmitter Security: OFF
Changing Hardware Switch Settings

In most cases, it is not necessary to change the setting of the hardware switches. If you need to change the switch settings, complete the steps outlined in the manual.

Definitions of these switches and their functions are provided below. If you determine that the settings must be changed, see below.

Failure Alarm Mode

If the 8750WA12 experiences a catastrophic failure in the electronics, the current output can be driven high (23.25 mA) or low (3.75 mA). The switch is set in the HIGH (23.25 mA) position when it is shipped from the factory.

Internal/External Analog Power

The Rosemount 8750WA12 4–20 mA loop may be powered internally or by an external power supply. The internal/external power supply switch determines the source of the 4–20 mA loop power. Transmitters are shipped from the factory with the switch set in the INTERNAL position.

The external power option is required for multidrop configurations. A 10–30 V dc external supply is required and the 4-20mA power switch must be set to “EXT” position. For further information on 4–20 mA external power, see Connect 4–20 mA Loop External Power Source on page 2-9.

Transmitter Security

The security switch on the 8750WA12 allows the user to lock out any configuration changes attempted on the transmitter. No changes to the configuration are allowed when the switch is in the ON position. The flow rate indication and totalizer functions remain active at all times.

With the switch in the ON position, you may still access and review any of the operating parameters and scroll through the available choices, but no actual data changes are allowed. Transmitter security is set in the OFF position when shipped from factory.

Changing Hardware Switch Settings

In most cases, it is not necessary to change the setting of the hardware switches. If you need to change the switch settings, complete the steps below:

NOTE

The hardware switches are located on the non-component side of the electronics board and changing their settings requires opening the electronics housing. If possible, carry out these procedures away from the plant environment in order to protect the electronics.

1. Disconnect power to the transmitter.
2. Loosen the housing door screw and open the housing door.
3. Identify the location of each switch (see Figure 2-2).
4. Change the setting of the desired switches with a small screwdriver.
5. Close the housing door and tighten the housing door screw.
Conduit Ports and Connections

Both the sensor and transmitter junction boxes have ports for ¾-inch NPT conduit connections. These connections should be made in accordance with local or plant electrical codes. Unused ports should be sealed with metal plugs. Proper electrical installation is necessary to prevent errors due to electrical noise and interference. Separate conduits are not necessary for the two cables, but a dedicated conduit line between each transmitter and sensor is required. Shielded cable must be used for best results in electrically noisy environments.

**Example 1:** Installing flanged sensors into an IP68 area. Sensors must be installed with IP68 cable glands and cable to maintain IP68 rating. Unused conduit connections must be properly sealed to prevent water ingress. For added protection, dielectric gel can be used to pot the sensor terminal block.

**Example 2:** Installing flowmeters into explosion proof areas. Conduit connections and conduit must be rated for use in the hazardous area to maintain flowmeter approval rating.

Conduit Cables

Run the appropriate size cable through the conduit connections in your magnetic flowmeter system. Run the power cable from the power source to the transmitter. Run the coil drive and electrode cables between the flowmeter and transmitter. Refer to Electrical Considerations for wire type. Prepare the ends of the coil drive and electrode cables as shown in Figure 2-3. Limit the unshielded wire length to 1-inch on both the electrode and coil drive cables. Excessive lead length or failure to connect cable shields can create electrical noise resulting in unstable meter readings.

- Installed signal wiring should not be run together and should not be in the same cable tray as AC or DC power wiring.
- Device must be properly grounded or earthed according to local electric codes.
- Rosemount combination cable model number 08712-0752-0001 (ft) or 08712-0752-0003 (m) is required to be used to meet EMC requirements.
Electrical Considerations

Before making any electrical connections to the Rosemount 8750WA12, consider the following standards and be sure to have the proper power supply, conduit, and other accessories.

Transmitter Input Power

The 8750WA12 transmitter is designed to be powered by 90-250 V ac, 50–60 Hz or 12–42 V dc. The seventh and eighth digits in the transmitter model number designate the appropriate power supply requirement.

<table>
<thead>
<tr>
<th>Model Number</th>
<th>Power Supply Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>90-250 V ac</td>
</tr>
<tr>
<td>2</td>
<td>12-42 V dc</td>
</tr>
</tbody>
</table>

Supply Wire Temperature Rating

Use 14 to 18 AWG wire rated for the proper temperature of the application. For connections in ambient temperatures exceeding 140 °F (60 °C), use wire rated to at least 194 °F (90 °C).

Disconnects

Connect the device through an external disconnect or circuit breaker. Clearly label the disconnect or circuit breaker and locate it near the transmitter.

Requirements for 90-250 V ac Power Supply

Wire the transmitter according to local electrical requirements for the supply voltage. In addition, follow the supply wire and disconnect requirements on page 2-9.

Requirements for 12-42 V dc Power Supply

Units powered with 12-42 V dc may draw up to 1 amp of current. As a result, the input power wire must meet certain gauge requirements.

Figure 2-4 shows the surge current for each corresponding supply voltage. For combinations not shown, you can calculate the maximum distance given the supply current, the voltage of the source, and the minimum start-up voltage of the transmitter, 12 V dc, using the following equation:

$$\text{Maximum Resistance} = \frac{\text{Supply Voltage} - 12\text{Vdc}}{1\text{amp}}$$

Use Table 2-1 and Table 2-2 to determine the maximum wire length allowable for your power supply and maximum resistance.

Figure 2-4. Supply Current versus Input Voltage
Installation Category
The installation category for the Rosemount 8750WA12 is (Overvoltage) Category II.

Overcurrent Protection
The Rosemount 8750WA12 Flowmeter Transmitter requires overcurrent protection of the supply lines. Maximum ratings of overcurrent devices are as follows:

<table>

<td>Bussman AGC3 or Equivalent</td>
</tr>
</tbody>
</table>

OPTIONS, CONSIDERATIONS, AND PROCEDURES
If your application of the 8750WA12 includes the use of options such as multidrop communications, positive zero return (PZR), auxiliary output control, or pulse output, certain requirements may apply in addition to those previously listed. Be prepared to meet these requirements before attempting to install and operate the Rosemount 8750WA12.

Connect Transmitter Power
To connect power to the transmitter, complete the following steps.

1. Ensure that the power source and connecting cable meet the requirements outlined on page 2-8.
2. Turn off the power source.
3. Open the power terminal cover.
4. Run the power cable through the conduit to the transmitter.
5. Loosen the terminal guard for terminals L1 and N.
6. Connect the power cable leads as shown in Figure 2-5.
   a. Connect ac Neutral or dc- to terminal N.
   b. Connect ac Line or dc+ to terminal L1.
   c. Connect ac Ground or dc Ground to the ground screw mounted on the transmitter enclosure.

![Figure 2-5. Transmitter Power Connections](image)

Connect 4–20 mA Loop External Power Source
The 4–20 mA output loop provides the process variable output from the transmitter. Its signal may be powered internally or externally. The default position of the internal/external analog power switch is in the internal position. The user-selectable power switch is located on the electronics board.
The 4–20 mA analog power loop may be powered from the transmitter itself. Resistance in the loop must be 1,000 ohms or less. If a Handheld Communicator or control system will be used, it must be connected across a minimum of 250 ohms resistance in the loop.

External
HART multidrop installations require a 10–30 V dc external power source (see Multidrop Communications on page 3-16). If a Handheld Communicator or control system is to be used, it must be connected across a minimum of 250 ohms resistance in the loop.

To connect external power to the 4–20 mA loop, complete the following steps.

1. Ensure that the power source and connecting cable meet the requirements outlined above and in Electrical Considerations on page 2-7.
2. Turn off the transmitter and analog power sources.
3. Run the power cable into the transmitter.
5. Connect +dc to Terminal 7.

Refer to Figure 2-6 on page 2-10.

Connect Pulse Output Power Source
The pulse output function provides an isolated switch-closure frequency signal that is proportional to the flow through the sensor. The signal is typically used in conjunction with an external totalizer or control system. The following requirements apply:

Supply Voltage: 5 to 24 V dc
Load Resistance: 1,000 to 100 k ohms (typical ~ 5 k)
Pulse Duration: 1.5 to 500 msec (adjustable), 50% duty cycle below 1.5 msec
Maximum Power: 2.0 watts up to 4,000 Hz and 0.1 watts at 10,000 Hz
Switch Closure: solid state switch

The pulse output option requires an external power source. Complete the following steps to connect an external power supply.
1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and pulse output power sources.
3. Run the power cable to the transmitter.
4. Connect \( -\text{dc} \) to terminal 6.
5. Connect \( +\text{dc} \) to terminal 5.

Refer to Figure 2-7 and Figure 2-8.

**Figure 2-7. Connecting to a Electromechanical Totalizer/Counter**

**Figure 2-8. Connecting to a Electronic Totalizer/Counter without Integral Power Supply**

**Connect Auxiliary Channel 1**

Auxiliary channel 1 can be configured as either a digital input or a digital output. When configured as an input, the following requirements apply:

- **Supply Voltage**: 5 to 28V DC
- **Maximum Power**: 2 watts
- **Switch Closure**: optically isolated solid state switch
- **Maximum Impedance**: 2.5 k\( \Omega \)

When using channel 1 as a digital input, the power source and the control relay must be connected to the transmitter. See Figure 2-9 for more details on this connection.
When configured as an output, the following requirements apply:

Supply Voltage: 5 to 28V DC
Maximum Power: 2 watts
Switch Closure: optically isolated solid state switch

When using channel 1 as a digital output, the power source must be connected to the transmitter. See Figure 2-10 for more details on this connection.

When connecting power to channel 1, complete the following steps:

1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and auxiliary power sources.
3. Run the power cable to the transmitter.
5. Connect +DC to terminal 9.

Figure 2-9. Connect Digital Input 1 to Relay or Input to Control System

Connect Auxiliary Channel 2

Auxiliary channel 2 is configured to provide a digital output based on the configuration parameters set in the transmitter.

The following requirements apply to this channel:

Supply Voltage: 5 to 28V DC
Maximum Power: 2 watts
Switch Closure: optically isolated solid state switch

When connecting power to channel 2, complete the following steps:

1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and auxiliary power sources.
3. Run the power cable to the transmitter.
5. Connect +DC to terminal 16.

See Figure 2-10 for more details on this connection.
SENSOR CONNECTIONS

This section covers the steps required to physically install the transmitter including wiring and calibration.

Rosemount Sensors

To connect the transmitter to a non-Rosemount sensor, refer to the appropriate wiring diagram in Appendix D: Wiring Diagrams. The calibration procedure listed is not required for use with Rosemount sensors.

Transmitter to Sensor Wiring

Flanged and wafer sensors have two conduit ports. Either one may be used for both the coil drive and electrode cables. Use the stainless steel plug that is provided to seal the unused conduit port.

A single dedicated conduit run for the coil drive and electrode cables is needed between a sensor and a remote transmitter. Bundled cables in a single conduit are likely to create interference and noise problems in your system. Use one set of cables per conduit run. See Figure 2-11 for proper conduit installation diagram and Table 2-3 for recommended cable. For integral and remote wiring diagrams refer to Figure 2-12.
Rosemount recommends using the combination signal and coil drive for N5 approved sensors for optimum performance.

Remote transmitter installations require equal lengths of signal and coil drive cables. Integrally mounted transmitters are factory wired and do not require interconnecting cables.

Lengths from 5 to 1,000 feet (1.5 to 300 meters) may be specified, and will be shipped with the sensor.

### Sensor to Remote Mount Transmitter Connections

Connect coil drive and electrode cables as shown in Figure 2-12.

**Do not connect ac power to the sensor or to terminals 1 and 2 of the transmitter**, or replacement of the electronics board will be necessary.

Section 3  
Installation of the 8750WA32

This section covers the steps required to physically install the magnetic flowmeter. Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please refer to the following safety messages before performing any operation in this section.

SAFETY MESSAGES

⚠️ This symbol is used throughout this manual to indicate that special attention to warning information is required.

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury:
Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified. Verify that the operating environment of the sensor and transmitter is consistent with the appropriate hazardous area approval.
Do not connect a Rosemount 8750WA32 to a non-Rosemount sensor.

⚠️ WARNING

Explosions could result in death or serious injury:
Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the approvals section of this reference manual for any restrictions associated with a safe installation.
Before connecting a handheld communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
Electrical shock can result in death or serious injury
Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.
Before installing the Rosemount 8750WA32 Magnetic Flowmeter Transmitter, there are several pre-installation steps that should be completed to make the installation process easier:

- Identify the options and configurations that apply to your application
- Set the hardware switches if necessary
- Consider mechanical, electrical, and environmental requirements

The mounting site for the 8750WA32 transmitter should provide enough room for secure mounting, easy access to conduit ports, full opening of the transmitter covers, and easy readability of the LOI screen (see Figure 3-1). The transmitter should be mounted in a manner that prevents moisture in conduit from collecting in the transmitter.

If the 8750WA32 is mounted remotely from the sensor, it is not subject to limitations that might apply to the sensor.
Environmental Considerations

To ensure maximum transmitter life, avoid temperature extremes and vibration. Typical problem areas include:

- high-vibration lines with integrally mounted transmitters
- warm-climate installations in direct sunlight
- outdoor installations in cold climates.

Remote-mounted transmitters may be installed in the control room to protect the electronics from a harsh environment and provides easy access for configuration or service.

Rosemount 8750WA32 transmitters require external power so there must be access to a suitable power source.

INSTALLATION PROCEDURES

Mount the Transmitter

Remote-mounted transmitters may be mounted on a pipe up to two inches in diameter or against a flat surface.

Pipe Mounting

To mount the transmitter on a pipe:

1. Attach the mounting bracket to the pipe using the mounting hardware.
2. Attach the 8750WA32 to the mounting bracket using the mounting screws.
Surface Mounting
To surface mount the transmitter:

1. Attach the 8750WA32 to the mounting location using the mounting screws.

Identify Options and Configurations
The standard application of the 8750WA32 includes a 4-20 mA output and control of the sensor coils. Other applications may require one or more of the following configurations or options:

- Multidrop Communication (locks the 4-20 mA output to 4 mA)
- HART Communication
- Pulse Output
- Digital Output
- Digital Input

Additional options may apply. Be sure to identify those options and configurations that apply to your situation, and keep a list of them nearby for consideration during the installation and configuration procedures.

Hardware Switches
The 8750WA32 electronics board is equipped with four user-selectable hardware switches. These switches set the Failure Alarm Mode, Internal/External Analog Power, Transmitter Security, and Internal/External Pulse Power. The standard configuration for these switches when shipped from the factory is as follows:

- Failure Alarm Mode: HIGH
- Internal/External Analog Power: INTERNAL
- Transmitter Security: OFF
- Internal/External Pulse Power: EXTERNAL

Definitions of these switches and their functions are provided below. If you determine that the settings must be changed, see below.

Failure Alarm Mode
If the 8750WA32 experiences a catastrophic failure in the electronics, the current output can be driven high (23.25 mA) or low (3.75 mA). The switch is set in the HIGH (23.25 mA) position when it is shipped from the factory.

Internal/External Analog Power
The 8750WA32 4–20 mA loop may be powered internally or by an external power supply. The internal/external power supply switch determines the source of the 4–20 mA loop power.

Transmitters are shipped from the factory with the switch set in the INTERNAL position.

The external power option is required for multidrop configurations. A 10–30 V DC external supply is required and the 4-20 mA power switch must be set to the EXTERNAL position. For further information on 4–20 mA external power, see “Connect 4–20 mA Loop External Power Source” on page 3-10.
Transmitter Security

The security switch on the 8750WA32 allows the user to lock out any configuration changes attempted on the transmitter. No changes to the configuration are allowed when the switch is in the ON position. The flow rate indication and totalizer functions remain active at all times.

With the switch in the ON position, you may still access and review any of the operating parameters and scroll through the available choices, but no actual data changes are allowed. Transmitter security is set in the OFF position when shipped from the factory.

Internal/External Pulse Power

The 8750WA32 pulse loop may be powered internally or by an external power supply. The internal/external power supply switch determines the source of the pulse loop power.

Transmitters are shipped from the factory with the switch set in the EXTERNAL position.

A 5-28 V DC external supply is required when the pulse power switch is set to the EXTERNAL position. For further information on the pulse external power, see “Connect Pulse Output Power Source” on page 3-11.

Changing Hardware Switch Settings

In most cases, it is not necessary to change the setting of the hardware switches. If you need to change the switch settings, complete the steps below:

NOTE
The hardware switches are located on the top side of the electronics board and changing their settings requires opening the electronics housing. If possible, carry out these procedures away from the plant environment in order to protect the electronics.

1. Disconnect power to the transmitter.
2. Remove electronics cover.
3. Remove LOI if applicable.
4. Identify the location of each switch (see Figure 3-2).
5. Change the setting of the desired switches with a small screwdriver.
6. Replace the electronics cover.
Conduit Ports and Connections

Both the sensor and transmitter junction boxes have ports for \( \frac{1}{2} \)-inch NPT conduit connections. These connections should be made in accordance with national, local or plant electrical codes. Unused ports should be sealed with metal plugs and PTFE tape or other thread sealant. Connections should also be made in accordance with area approval requirements, see examples below for details. Proper electrical installation is necessary to prevent errors due to electrical noise and interference. Separate conduits are not necessary for the coil drive and signal cables connecting the transmitter to the sensor, but a dedicated conduit line between each transmitter and sensor is required. A shielded cable must be used.

When installing flanged sensors into an IP68 area. Sensors must be installed with IP68 cable glands, cable, and conduit to maintain IP68 rating. Unused conduit connections must be properly sealed to prevent water ingress. For added protection, dielectric gel can be used to pot the sensor terminal block.

Conduit Cables

Run the appropriate size cable through the conduit connections in your magnetic flowmeter system. Run the power cable from the power source to the transmitter. Do not run power cables and output signal cables in the same conduit. For remote mount installations, run the coil drive and electrode cables between the flowmeter and transmitter. Refer to Electrical Considerations for wire type. Prepare the ends of the coil drive and electrode cables as shown in Figure 3-3. Limit the unshielded wire length to 1-inch on both the electrode and coil drive cables. Excessive lead length or failure to connect cable shields can create electrical noise resulting in unstable meter readings.
Electrical Considerations

Before making any electrical connections to the Rosemount 8750WA32, consider the following standards and be sure to have the proper power supply, conduit, and other accessories. When preparing all wire connections, remove only the insulation required to fit the wire completely under the terminal connection. Removal of excessive insulation may result in an unwanted electrical short to the transmitter housing or other wire connections.

**Transmitter Input Power**

The 8750WA32 transmitter is designed to be powered by 90-250 V AC, 50–60 Hz or 12–42 V DC. The twelfth digit in the transmitter model number designates the appropriate power supply requirement.

<table>
<thead>
<tr>
<th>Model Number</th>
<th>Power Supply Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>90-250 V AC</td>
</tr>
<tr>
<td>2</td>
<td>12-42 V DC</td>
</tr>
</tbody>
</table>

**Supply Wire Temperature Rating**

Use 14 to 18 AWG wire rated for the proper temperature of the application. For connections in ambient temperatures exceeding 140 °F (60 °C), use wire rated to at least 194 °F (90 °C).

**Disconnects**

Connect the device through an external disconnect or circuit breaker. Clearly label the disconnect or circuit breaker and locate it near the transmitter.

**Requirements for 90-250 V AC Power Supply**

Wire the transmitter according to national, local, and plant electrical requirements for the supply voltage. In addition, follow the supply wire and disconnect requirements on page 3-9.

**Requirements for 12-42 V DC Power Supply**

Units powered with 12-42 V DC may draw up to 1 amp of current. As a result, the input power wire must meet certain gauge requirements.
Figure 3-4 shows the supply current for each corresponding supply voltage. For combinations not shown, you can calculate the maximum distance given the supply current, the voltage of the source, and the minimum start-up voltage of the transmitter, 12 V DC, using the following equation:

\[
\text{Maximum Resistance} = \frac{\text{Supply Voltage}}{\text{1 amp}}
\]

Use Table 3-1 and Table 3-2 to determine the maximum wire length allowable for your power supply and maximum resistance.

Installation Category

The installation category for the Rosemount 8750WA32 is (overvoltage) Category II.

Overcurrent Protection

The Rosemount 8750WA32 Flowmeter Transmitter requires overcurrent protection of the supply lines. Maximum ratings of overcurrent devices are as follows:

<table>

</tbody>
</table>

OPTIONS, CONSIDERATIONS, AND PROCEDURES

If your application of the 8750WA32 includes the use of options such as multidrop communications, DI/DO, or pulse output, certain requirements may apply in addition to those previously listed. Be prepared to meet these requirements before attempting to install and operate the Rosemount 8750WA32.

Connect Transmitter Power

To connect power to the transmitter, complete the following steps.

1. Ensure that the power source and connecting cable meet the requirements outlined on page 3-8.
2. Turn off the power source.
3. Open the power terminal cover.
4. Run the power cable through the conduit to the transmitter.
5. Connect the power cable leads as shown in Figure 3-5.
   a. Connect AC Neutral or DC- to terminal 9.
   b. Connect AC Line or DC+ to terminal 10.
   c. Connect AC Ground or DC Ground to the ground screw mounted inside the transmitter enclosure.
Connect 4–20 mA Loop
External Power Source

The 4–20 mA output loop provides the process variable output from the transmitter. The analog output may be powered internally or externally. The default position of the internal/external analog power switch is in the INTERNAL position. The user-selectable power switch is located on the electronics board. The analog output is galvanically isolated from ground.

Figure 3-6. DC Load Limitations
(Analog Output)

\[ R_{\text{max}} = 31.25 (V_{ps} - 10.8) \]
\[ V_{ps} = \text{Power Supply Voltage (Volts)} \]
\[ R_{\text{max}} = \text{Maximum Loop Resistance (Ohms)} \]

Internal
The 4–20 mA analog power loop may be powered from the transmitter itself. Resistance in the loop must be 600 ohms or less. If a HART communication device or control system will be used, it must be connected across a minimum of 250 ohms resistance in the loop.
External
HART multidrop installations require a 10–30 V DC external power source. Resistance in the loop must be 1000 ohms or less. If a HART communication device or control system is to be used, it must be connected across a minimum of 250 ohms resistance in the loop.

To connect external power to the 4–20 mA loop, complete the following steps.
1. Ensure that the power source and connecting cable meet the requirements outlined above and in “Electrical Considerations” on page 3-7.
2. Turn off the transmitter and analog power sources.
3. Run the power cable into the transmitter.
4. Connect -4–20 mA power to Terminal 1.
5. Connect +4–20 mA power to Terminal 2.

Refer to Figure 3-7 on page 3-11.

Figure 3-7. 4–20 mA Loop Power Connections

Connect Pulse Output Power Source
The pulse output function provides a galvanically isolated switch-closure frequency signal that is proportional to the flow through the sensor. The signal is typically used in conjunction with an external totalizer or control system. The default position of the internal/external pulse power switch is in the EXTERNAL position. The user-selectable power switch is located on the electronics board.
External

For transmitters with the internal/external pulse power switch set in the EXTERNAL position, the following requirements apply.

Supply Voltage: 5 to 28 V DC
Load Resistance: 1,000 to 100 k ohms (typical ~ 5 k)
Pulse Duration: 1.5 to 500 msec (adjustable), 50% duty cycle below 1.5 msec
Maximum Power: 2.0 watts up to 4,000 Hz and 0.1 watts at 10,000 Hz
Switch Closure: solid state switch

Complete the following steps to connect an external power supply.

1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and pulse output power sources.
3. Run the power cable to the transmitter.
4. Connect – DC to terminal 3.
5. Connect + DC to terminal 4.

Refer to Figure 3-8 and Figure 3-9.

Internal

The pulse power loop may be powered from the transmitter itself. Supply voltage from the transmitter is 10 V. Refer to Figure 3-8 and Figure 3-9 and connect the transmitter directly to the counter.

1. Turn off the transmitter.
2. Connect – DC to terminal 3.
3. Connect + DC to terminal 4.
The digital output control function allows you to externally signal a zero flow, reverse flow, empty pipe, or transmitter fault condition. The following requirements apply:
If you are using digital output control, you need to connect the power source and control relay to the transmitter. To connect external power for digital output control, complete the steps:

1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and digital power sources.
3. Run the power cable to the transmitter.
5. Connect +DC to terminal 8.

Refer to Figure 3-10.

**Figure 3-10. Connect Digital Output to Relay or Input to Control System**

**Figure 3-11. Digital Output Schematic**

Supply Voltage: 5 to 28V DC  
Maximum Power: 2 watts  
Switch Closure: optically isolated solid state switch
Connect Digital Input

The Digital Input can provide positive zero return (PZR), net totalizer reset, or transmitter reset. The following requirements apply:

- Supply Voltage: 5 to 28V DC
- Maximum Power: 2 watts
- Switch Closure: optically isolated solid state switch
- Input Impedance: 2.5 kΩ

To connect the Digital Input, complete the following steps.

1. Ensure that the power source and connecting cable meet the requirements outlined previously.
2. Turn off the transmitter and digital power sources.
3. Run the power cable to the transmitter.
4. Run the 5-28 V DC signal cable to the transmitter.
5. Connect –DC to terminal 5.

Refer to Figure 3-12.

NOTE

For installations where Digital Input (DI) is required and the analog output is not required, the DI circuit can be powered by the internal analog source. To wire this connection, connect terminal 1 (-mA) to terminal 5 (-DI), and connect terminal 2 (+mA) to terminal 6 (+DI) with the relay contact in series.

SENSOR CONNECTIONS

This section covers the steps required to physically install the transmitter including wiring and calibration.

Rosemount Sensors

To connect the transmitter to a non-Rosemount sensor, refer to the appropriate wiring diagram in “Universal Flowtube Sensor Wiring Diagrams” on page E-1. The calibration procedure listed is not required for use with Rosemount sensors.

Transmitter to Sensor Wiring

Flanged and wafer sensors have two conduit ports as shown in Figure 3-15. Either one may be used for both the coil drive and electrode cables. Use the stainless steel plug that is provided to seal the unused conduit port. Use Teflon tape or thread sealant appropriate for the installation when sealing the conduit.

A single dedicated conduit run for the coil drive and electrode cables is needed between a sensor and a remote transmitter. Bundled cables in a single conduit are likely to create interference and noise problems in your system. Use one set of cables per conduit run. See Figure 3-15 for proper conduit installation diagram and Table 3-3 for recommended cable. For integral and remote wiring diagrams refer to Figure 3-17.

¹ Combination Signal and Coil Drive Cable (18 AWG) used for integral and remote wiring diagrams.
Rosemount recommends using the combination signal and coil drive for N5 approved sensors for optimum performance.

Remote transmitter installations require equal lengths of signal and coil drive cables. Integrally mounted transmitters are factory wired and do not require interconnecting cables.

Lengths from 5 to 1,000 feet (1.5 to 300 meters) may be specified, and will be shipped with the sensor.

**Conduit Cables**

Run the appropriate size cable through the conduit connections in your magnetic flowmeter system. Run the power cable from the power source to the transmitter. Run the coil drive and electrode cables between the sensor and transmitter.

Prepare the ends of the coil drive and electrode cables as shown in Figure 3-16. Limit the unshielded wire length to 1-inch on both the electrode and coil drive cables.

**NOTE**
Excessive lead length or failure to connect cable shields can create electrical noise resulting in unstable meter readings.

---

(1) For remote mount installations, combination signal and coil drive cable should be limited to less than 330 ft. (100 m).

Figure 3-16. Cable Preparation Detail

- 1.00

Section 4  Configuration

INTRODUCTION

This section covers basic operation, software functionality, and configuration procedures for the Rosemount 8750WA12 Magnetic Flowmeter Transmitter.

The Rosemount 8750WA12 features a full range of software functions for configuration of output from the transmitter. Software functions are accessed through the LOI, AMS, a Handheld Communicator, or a control system. Configuration variables may be changed at any time and specific instructions are provided through on-screen instructions.

INSTALLATION CHECK AND GUIDE

Use this guide to check new installations of Rosemount magnetic flowmeter systems that appear to malfunction.

Before You Begin

Transmitter

Apply power to your system before making the following transmitter checks.
1. Verify that the correct sensor calibration number is entered in the transmitter. The calibration number is listed on the sensor nameplate.

2. Verify that the correct sensor line size is entered in the transmitter. The line size value is listed on the sensor nameplate.

3. Verify that the analog range of the transmitter matches the analog range in the control system.

4. Verify that the forced analog output of the transmitter produces the correct output at the control system.

Sensor

Be sure that power to your system is removed before beginning sensor checks.

1. **For horizontal flow installations**, ensure that the electrodes remain covered by process fluid.

2. **For vertical or inclined installations**, ensure that the process fluid is flowing up into the sensor to keep the electrodes covered by process fluid.

3. Ensure that the grounding straps on the sensor are connected to grounding rings, lining protectors, or the adjacent pipe flanges. Improper grounding will cause erratic operation of the system.

Wiring

1. The signal wire and coil drive wire must be twisted shielded cable. Emerson Process Management, Rosemount division recommends 20 AWG twisted shielded cable for the electrodes and 14 AWG twisted shielded cable for the coils.

2. The cable shield must be connected at both ends of the electrode and coil drive cables. Connection of the shield at both ends is absolutely necessary for proper operation.

3. The signal and coil drive wires must be separate cables, unless Emerson Process Management specified combo cable is used. See Table 2-3 on page 2-13.

4. The single conduit that houses both the signal and coil drive cables should not contain any other wires.

Process Fluid

1. The process fluid conductivity should be 5 microsiemens (5 micro mhos) per centimeter minimum.

2. The process fluid must be free of air and gasses.

3. The sensor should be full of process fluid.

Refer to Section 5 "Maintenance and Troubleshooting" for further information.

**LOCAL OPERATOR INTERFACE**

The optional Local Operator Interface (LOI) provides an operator communications center for the 8750WA12D. By using the LOI, the operator can access any transmitter function for changing configuration parameter settings, checking totalized values, or other functions. The LOI is integral to the transmitter housing.
8750WA12 LOI BASIC FEATURES

The basic features of the 8750WA12 LOI include display control, totalizer, data entry, and transmitter parameters. These features provide control of all transmitter functions, see Figure 4-1.

Display Control Keys
The display control keys provide control over the variable displayed on the LOI screen. Push FLOW RATE to display the process variable, or push TOTALIZE to display the totalized value.

Totalizer Keys
The totalizer keys enable you to start, stop, read, and reset the totalizer.

Data Entry Keys
The data entry keys enable you to move the display cursor, incrementally increase the value, or enter the selected value.

Transmitter Parameter Keys
The transmitter parameter keys provide direct access to the most common transmitter parameters and stepped access to the advanced functions of the 8750WA12D through the AUX. FUNCTION key.
Data Entry

The LOI keypad does not have numerical keys. Numerical data is entered by the following procedure.

1. Access the appropriate function.
2. Use **SHIFT** to highlight the digit you want to enter or change.
3. Use **INCR.** to change the highlighted value. For numerical data, **INCR.** toggle through the digits 0–9, **decimal point**, and **dash**. For alphabetical data, toggle through the letters of the alphabet A–Z, digits 0–9, and the symbols •, &amp;, +, −, *, /, $, @, %, and the **blank space**. (**INCR.** is also used to toggle through pre-determined choices that do not require data entry.)
4. Use **SHIFT** to highlight other digits you want to change and change them.
5. Press **ENTER**.

Selecting Options

To select pre-defined software options on the LOI, use the following procedure:

1. Access the appropriate option.
2. Use **SHIFT** or **INCR.** to toggle between the applicable choices.
3. Press **ENTER** when the desired choice is displayed on the screen.

LOI EXAMPLES

Use the TRANSMITTER PARAMETER keys shown in Figure 4-1 to change the parameters, which are set in one of two ways, table values or select values.

**Table Values:**
Parameters such as units, that are available from a predefined list

**Select Values:**
Parameters that consist of a user-created number or character string, such as calibration number; values are entered one character at a time using the data entry keys

Table Value Example

Setting the sensor line size:

1. Press **SENSOR SIZE**.
2. Press **SHIFT** or **INCR.** to increase (incrementally) the size to the next value.
3. When you reach the desired size, press **ENTER**.
4. Set the loop to manual if necessary, and press **ENTER** again.

After a moment, the LCD will display the new sensor size and the maximum flow rate.

Select Value Example

Changing the ANALOG OUTPUT RANGE:

1. Press **ANALOG OUTPUT RANGE**.
2. Press **SHIFT** to position the cursor.
3. Press **INCR.** to set the number.
4. Repeat steps 2 and 3 until desired number is displayed.
5. Press **ENTER**.

After a moment, the LCD will display the new analog output range.
Table 4-2. 8750WA12 LOI Data Entry Keys and Functions

<table>

Analog Output Range

Sets the desired 20 mA point – **must set the sensor size first**

Pulse Output Scaling

Sets one pulse to a selectable number of volume units – **must set the sensor size first**

Damping

Sets response time (single pole time constant), in seconds, to a step change in flow rate

Transmitter Information

Allows you to view and change useful information about the transmitter and sensor

Empty Pipe Tuning

Allowable range 3.0 - 2000.0
The following error messages may appear on the LOI screen. See Table 5-1 on page 5-2 for potential causes and corrective actions for these errors:

- Electronics Failure
- Coil open circuit
- Digital trim failure
- Auto zero failure
- Auto trim failure
- Flow rate >42 ft/sec
- Analog out of range
- PZR activated
- Empty pipe
- Reverse flow
- Reverse flow indicator
  (A flashing letter “R” on the LOI indicates a reverse flow)
- Totalizer indicator
  (A flashing letter “T” on the LOI indicates to totalizer is activated)

Review

The 8750WA12 includes a capability that enables you to review the configuration variable settings.

The flowmeter configuration parameters set at the factory should be reviewed to ensure accuracy and compatibility with your particular application of the flowmeter.

NOTE
If you are using the LOI to review variables, each variable must be accessed as if you were going to change its setting. The value displayed on the LOI screen is the configured value of the variable.

The process variables measure flow in several ways that reflect your needs and the configuration of your flowmeter. When commissioning a flowmeter, review each process variable, its function and output, and take corrective action if necessary before using the flowmeter in a process application.

**Process Variable (PV)** – The actual measured flow rate in the line. Use the Process Variable Units function to select the units for your application.

**Percent of Range** – The process variable as a percentage of the Analog Output range, provides an indication of the current flow measurement in relation to the configured range of the flowmeter. For example, the Analog Output range may be defined as 0 gal/min to 20 gal/min. If the measured flow is 10 gal/min, the percent of range is 50 percent.

**Analog Output** – The analog output variable provides the analog value for the flow rate. The analog output refers to the industry standard output in the 4–20 mA range.

**Totalizer Setup** – Provides a reading of the total flow of the flowmeter since the totalizer was last reset. The totalizer value should be zero during commissioning on the bench, and the units should reflect the volume units of the flow rate. If the totalizer value is not zero, it may need to be reset. This function also allows for configuration of the totalizer parameters.
**Pulse Output** – The pulse output variable provides the pulse value for the flow rate.

The *Primary Variable* shows the current measured flow rate. This value determines the analog output from the transmitter.

The *PV% Range* shows where in the flow range the current flow value is as a percentage of the configured span.

The *PV Analog Output* displays the mA output of the transmitter corresponding to the measured flow rate.

The *Totalizer Setup* menu allows for the viewing and configuration of the totalizer parameters.

The *Totalizer Units* allow for the configuration of the units that the totalized value will be displayed as. These units are independent of the flow units.

*Measured Gross Total*

*Measured gross total* provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset.

**NOTE**

To reset the measured gross total value, the line size must be changed.

*Measured Net Total*

*Measured net total* provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset. When reverse flow is enabled, the net total represents the difference between the total flow in the forward direction less the total flow in the reverse direction.

*Measured Reverse Total*

*Measured reverse total* provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter in the reverse direction since the totalizer was last reset. This value is only totalized when reverse flow is enabled.

*Start Totalizer*

*Start totalizer* starts the totalizer counting from its current value.
Stop Totalizer

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 1, 4, 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>8750WA12 LOI Key</td>
<td>START/STOP</td>
</tr>
</tbody>
</table>

Stop totalizer interrupts the totalizer count until it is restarted again. This feature is often used during pipe cleaning or other maintenance operations.

Reset Totalizer

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 1, 4, 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>8750WA12 LOI Key</td>
<td>READ/RESET</td>
</tr>
</tbody>
</table>

Reset totalizer resets the net totalizer value to zero. The totalizer must be stopped before resetting.

**NOTE**
The totalizer value is saved in the Non-Volatile memory of the electronics every three seconds. Should power to the transmitter be interrupted, the totalizer value will start at the last saved value when power is re-applied.

**Pulse Output**
The Pulse Output displays the current value of the pulse signal.

**BASIC SETUP**
The basic configuration functions of the Rosemount 8750WA12 must be set for all applications of the transmitter in a magnetic flowmeter system. If your application requires the advanced functionality features of the Rosemount 8750WA12, see Section 4 "Operation" of this manual.

**Tag**
Tag is the quickest and shortest way of identifying and distinguishing between transmitters. Transmitters can be tagged according to the requirements of your application. The tag may be up to eight characters long.

**Flow Units**
Flow Units set the output units for the Primary Variable which controls the analog output of the transmitter.

**Primary Variable Units**
The Primary Variable Units specifies the format in which the flow rate will be displayed. Units should be selected to meet your particular metering needs.

</table>

The Rosemount 8750WA12 provides a selection of standard unit configurations that meet the needs of most applications (see “Flow Units” on page 4-8). If your application has special needs and the standard configurations do not apply, the Rosemount 8750WA12 provides the flexibility to configure the transmitter in a custom-designed units format using the `special units` variable.

**Special Volume Unit**

`Special volume unit` enables you to display the volume unit format to which you have converted the base volume units. For example, if the special units are abc/min, the special volume variable is abc. The volume units variable is also used in totalizing the special units flow.
Base Volume Unit

| 375 Fast Keys | 1, 3, 2, 2, 2 |

Base volume unit is the unit from which the conversion is being made. Set this variable to the appropriate option.

Conversion Number

| 375 Fast Keys | 1, 3, 2, 2, 3 |

The special units conversion number is used to convert base units to special units. For a straight conversion of volume units from one to another, the conversion number is the number of base units in the new unit. For example, if you are converting from gallons to Drums and there are 55 gallons in a barrel, the conversion factor is 55.

Base Time Unit

| 375 Fast Keys | 1, 3, 2, 2, 4 |

Base time unit provides the time unit from which to calculate the special units. For example, if your special units is a volume per minute, select minutes.

Special Flow Rate Unit

| 375 Fast Keys | 1, 3, 2, 2, 5 |

Special flow rate unit is a format variable that provides a record of the units to which you are converting. The Handheld Communicator will display a special units designator as the units format for your primary variable. The actual special units setting you define will not appear. Four characters are available to store the new units designation. The 8750WA12 LOI will display the four character designation as configured.

Example

To display flow in Drums per hour, and one Drum is equal to 55 gallons, the procedure would be:

Set the Volume Unit to Drum.
Set the Base Volume Unit to gallons.
Set the Input Conversion Number to 55.
Set the Time Base to Hour.
Set the Rate Unit to DR/H.

Line Size

| 375 Fast Keys | 1, 3, 3 |
| 8750WA12 LOI Key | sensor SIZE |

The line size (sensor size) must be set to match the actual sensor connected to the transmitter. The size must be specified in inches according to the available sizes listed below. If a value is entered from a control system or Handheld Communicator that does not match one of these figures, the value will go to the next highest option.

The line size (inches) options are as follows:

0.1, 0.15, 0.25, 0.30, 0.50, 0.75, 1, 1.5, 2, 2.5, 3, 4, 6, 8, 10, 12, 14, 16, 18, 20, 24, 28, 30, 32, 36, 40, 42, 44, 48, 54, 56, 60, 64, 72, 80
The upper range value (URV), or analog output range, is preset to 30 ft/s at the factory. The units that appear will be the same as those selected under the units parameter.

The URV (20 mA point) can be set for both forward or reverse flow rate. Flow in the forward direction is represented by positive values and flow in the reverse direction is represented by negative values. The URV can be any value from \(-39.3 \text{ ft/s}\) to \(+39.3 \text{ ft/s}\) (-12 m/s to +12 m/s), as long as it is at least 1 ft/s (0.3 m/s) from the lower range value (4 mA point). The URV can be set to a value less than the lower range value. This will cause the transmitter analog output to operate in reverse, with the current increasing for lower (or more negative) flow rates.

**NOTE**

Line size, special units, and density (for mass units of measurement only) must be selected prior to configuration of URV and LRV.

---

Set the lower range value (LRV), or 4 mA set point to change the size of the range (or span) between the URV and LRV. Under normal circumstances, the LRV should be set to a value near the minimum expected flow rate to maximize resolution. The LRV must be between \(-39.3 \text{ ft/s}\) to \(+39.3 \text{ ft/s}\) (-12 m/s to +12 m/s).

**NOTE**

Line size, special units, and density must be selected prior to configuration of URV and LRV.

---

**Example**

If the URV is greater than the LRV, the analog output will saturate at 3.9 mA when the flow rate falls below the selected 4 mA point.

The minimum allowable span between the URV and LRV is 1 ft/s (0.3 m/s). Do not set the LRV within 1 ft/s (0.3 m/s) of the 20 mA point. For example, if the URV is set to 15.67 ft/s (4.8 m/s) and if the desired URV is greater than the LRV, then the highest allowable LRV setting would be 14.67 ft/s (4.5 m/s). If the desired URV is less than the LRV, then the lowest allowable LRV would be 16.67 ft/s (5.1 m/s).
Calibration Number

The sensor *calibration number* is a 16-digit number used to identify sensors calibrated at the Rosemount factory. The calibration number is also printed inside the sensor terminal block or on the sensor name plate. The number provides detailed calibration information to the Rosemount 8750WA12. To function properly within accuracy specifications, the number stored in the transmitter must match the calibration number on the sensor exactly.

**NOTE**

Sensors from manufacturers other than Rosemount Inc. can also be calibrated at the Rosemount factory. Check the sensor for Rosemount calibration tags to determine if a 16-digit calibration number exists for your sensor.

**NOTE**

Be sure the calibration number reflects a calibration to a Rosemount reference transmitter. If the calibration number was generated by a means other than a certified Rosemount flow lab, accuracy of the system may be compromised.

If your sensor is not a Rosemount sensor and was not calibrated at the Rosemount factory, contact your Emerson Process Management representative for assistance.

If your sensor is imprinted with an eight-digit number or a k-factor, check in the sensor wiring compartment for the sixteen-digit calibration number. If there is no serial number, contact the factory for a proper conversion.

PV Damping

Adjustable between 0.0 and 256 seconds

*PV Damping* allows selection of a response time, in seconds, to a step change in flow rate. It is most often used to smooth fluctuations in output.
8750WA32 LOI BASIC FEATURES

The basic features of the LOI include 4 navigational arrow keys that are used to access the menu structure. See Figure 4-1

Figure 4-2. Local Operator Interface Keypad

Data Entry

The LOI keypad does not have numerical keys. Numerical data is entered by the following procedure.

1. Access the appropriate function.
2. Use the key to move to the value to change.
3. Use the UP and DOWN ARROWS to change the highlighted value. For numerical data, toggle through the digits 0–9, decimal point, and dash. For alphabetical data, toggle through the letters of the alphabet A–Z, digits 0–9, and the symbols •, &+, -, *, /, $, @, %, and the blank space.
4. Use the to highlight other digits you want to change and change them.
5. Press “E” (the left arrow key) when all changes are complete to save the entered values.

LOI EXAMPLES

Use the DOWN ARROW to access the menu structure in Table 4-4. Use the ARROW KEYS to select the desired parameters to review/change. Parameters are set in one of two ways, Table Values or Select Values.

Table Values:
Parameters such as units, that are available from a predefined list

Select Values:
Parameters that consist of a user-created number or character string, such as calibration number; values are entered one character at a time using the ARROW KEYS.
Table Value Example

Setting the SENSOR SIZE:

1. Press the DOWN arrow to access the menu.
2. Select the Basic Set Up menu.
3. Select line size from the Basic set-up menu.
4. Press the UP or DOWN arrow to increase/decrease (incrementally) the sensor size to the next value.
5. When you reach the desired size, press “E” (the left arrow).
6. Set the loop to manual if necessary, and press “E” again.

After a moment, the LCD will display the new sensor size and the maximum flow rate.

Select Value Example

Changing the ANALOG OUTPUT RANGE:

1. Press the DOWN arrow to access the menu.
2. Select the Basic Set Up menu.
3. Using the arrow keys, select PV URV from the Basic Setup menu.
4. Press RIGHT arrow key to position the cursor.
5. Press UP or DOWN to set the number.
6. Repeat steps 2 and 3 until desired number is displayed.
7. Press “E”.

After a moment, the LCD will display the new analog output range.

Display Lock

The 8750WA32 display can be locked to prevent unintentional configuration changes. The display lock can be activated through a HART communication device, or by holding the UP arrow for 10 seconds. When the display lock is activated, DL will appear in the lower left hand corner of the display. To deactivate the display lock (DL), hold the UP arrow for 10 seconds. Once deactivated, the DL will no longer appear in the lower left hand corner of the display.

Start Totalizer

To start the totalizer, press the DOWN arrow to display the totalizer screen and press “E” to begin totalization. A symbol  will flash in the lower right hand corner indicating that the meter is totalizing.

Stop Totalizer

To stop the totalizer, press the DOWN arrow to display the totalizer screen and press “E” to end totalization. The flashing symbol  will no longer display in the lower right hand corner indicating that the meter has stopped totalizing.

Reset Totalizer

To reset the totalizer, press the DOWN arrow to display the totalizer screen and follow the procedure above to stop totalization. Once totalization has stopped, press the RIGHT arrow key to reset the NET total value to zero.

To reset the gross total value, you must change the line size. See “Line Size” on page 4-10 for details on how to change the line size.
Table 4-4. 8750WA32
LOI Menu Tree
Section 5  Advanced Functionality of the 8750WA12

INTRODUCTION

This section contains information for advanced configuration parameters and diagnostics.

The software configuration settings for the Rosemount 8750WA12 can be accessed through a HART-based communicator, Local Operator Interface (LOI), or through a control system. The software functions for the HART Communicator are described in detail in Appendix E of the manual. It provides an overview and summary of communicator functions. For more complete instructions, see the communicator manual. Before operating the Rosemount 8750WA12 in an actual installation, you should review all of the factory set configuration data to ensure that they reflect the current application.

DIAGNOSTICS

Diagnostics are used to verify that the transmitter is functioning properly, to assist in troubleshooting, to identify potential causes of error messages, and to verify the health of the transmitter and sensor. Diagnostic tests can be initiated through the use of a HART-based communications device, the Local Operator Interface, or through the control system.

Rosemount offers several different diagnostic suites providing various functionality.

Standard diagnostics included with every Rosemount 8750WA12 transmitter are Empty Pipe detection, Electronics Temperature monitoring, Coil Fault detection, and various loop and transmitter tests.

Advanced diagnostics suite option one (DA1 option) contains advanced diagnostics for High Process Noise detection and Grounding and Wiring fault detection.

Advanced diagnostics suite option two (DA2 option) contains advanced diagnostics for the 8714i Meter Verification. This diagnostic is used to verify the accuracy and performance of the magnetic flowmeter installation.

Diagnostic Controls

The diagnostic controls menu provides a centralized location for enabling or disabling each of the diagnostics that are available. Note that for some diagnostics to be available, a diagnostics suite package is required.
Empty Pipe

| 375 Fast Keys | 1, 2, 1, 1 |

Turn the empty pipe diagnostic on or off as required by the application. For more details on the empty pipe diagnostic, see Appendix C: “Diagnostics”.

High Process Noise

| 375 Fast Keys | 1, 2, 1, 2 |

Turn the high process noise diagnostic on or off as required by the application. For more details on the high process noise diagnostic, see Appendix C: “Diagnostics”.

Grounding / Wiring

| 375 Fast Keys | 1, 2, 1, 3 |

Turn the grounding / wiring diagnostic on or off as required by the application. For more details on the grounding / wiring diagnostic, see Appendix C: “Diagnostics”.

Electronics Temperature

| 375 Fast Keys | 1, 2, 1, 4 |

Turn the electronics temperature diagnostic on or off as required by the application. For more details on the electronics temperature diagnostic, see Appendix C: “Diagnostics”.

Basic Diagnostics

| 375 Fast Keys | 1, 2, 2 |

The basic diagnostics menu contains all of the standard diagnostics and tests that are available in the 8750WA12 transmitter.

Self Test

| 375 Fast Keys | 1, 2, 2, 1 |

The transmitter test initiates a series of diagnostic tests that are not performed continuously during normal operation. It performs the following tests:

- Display Test
- RAM test
- PROM test

During the entire test, all outputs respond to flow signal. The test requires about ten seconds to complete.

AO Loop Test

| 375 Fast Keys | 1, 2, 2 |

The AO Loop test will cause the transmitter to drive the analog output to a desired electrical current on terminals 7 and 8. The actual loop current can then be independently measured and compared against the desired level set in the transmitter. On the LOI, the test will end after five minutes if the transmitter is not returned to normal operation manually.

4 mA

| 375 Fast Keys | 1, 2, 2, 1 |

Fix the analog loop current at 4 mA.
Fix the analog loop current at 20 mA.

**Simulate Alarm**

Send the analog output into an alarm mA value. Actual mA value depends on the alarm configuration.

- Rosemount Standard High Alarm – 22.6 mA
- Rosemount Standard Low Alarm – 3.75 mA
- Namur Compliant High Alarm – 22.6 mA
- Namur Compliant Low Alarm – 3.5 mA

Fix the analog loop current to some other mA value between 3.5 mA and 23.0 mA.

This command cancels the analog loop test and returns the analog output back into normal operating mode.

**Pulse Output Loop Test**

The Pulse Output Loop Test will cause the transmitter to drive the frequency output at terminals 5 and 6 to a desired value. The actual pulse output can then be measured by auxiliary equipment and compared to the desired pulse output level set in the transmitter. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

Set the value of the pulse output for the test to a value between 1 pulse/day to 10,000 Hz.

This command cancels the pulse output loop test and returns the pulse output back into normal operating mode.

Empty Pipe allows you to view the current value and configure the diagnostic parameters. For more detail on this parameter see Appendix C: "Diagnostics".
Empty Pipe Value

Read the current Empty Pipe Value. This number is a unitless number and is calculated based on multiple installation and process variables. For more detail on this parameter see Appendix C: "Diagnostics".

Empty Pipe Trigger Level

Limits: 3 to 2000

Configure the threshold limit that the empty pipe value must exceed before the diagnostic alert activates. Default from the factory is set to 100. For more detail on this parameter see Appendix C: "Diagnostics".

Empty Pipe Counts

Limits: 5 to 50

Configure the number of consecutive times that the empty pipe value must exceed the empty pipe trigger level before the diagnostic alert activates. Counts are taken at 1.5 second intervals. Default from the factory is set to 5. For more detail on this parameter see Appendix C: "Diagnostics".

Electronics Temperature

Electronics Temperature allows you to view the current value for the electronics temperature.

Flow Limit 1

Configure the Parameters that will determine the criteria for activating a HART alert if the measured flow rate falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

Control 1

Turns the Flow Limit 1 HART Alert ON or OFF.

ON – The transmitter will generate a HART alert when the defined conditions are met.

OFF – The transmitter will not generate a HART alert for the Flow Limit 1.
Mode 1

375 Fast Keys 1, 2, 2, 6, 2

Mode that determines when the Flow Limit 1 HART Alert will activate.

> High Limit – The HART Alert will activate when the measured flow rate exceeds the High Limit 1 set point.

< Low Limit – The HART Alert will activate when the measured flow rate falls below the Low Limit 1 set point.

In Range – The HART Alert will activate when the measured flow rate is between the High Limit 1 and Low Limit 1 set points.

Out of Range – The HART Alert will activate when the measured flow rate exceeds the High Limit 1 set point or falls below the Low Limit 1 set point.

High Limit 1

375 Fast Keys 1, 2, 2, 6, 3

Set the flow rate value that corresponds to the high limit set point for the Flow Limit 1 alert.

Low Limit 1

375 Fast Keys 1, 2, 2, 6, 4

Set the flow rate value that corresponds to the low limit set point for the Flow Limit 1 alert.

Flow Limit Hysteresis

375 Fast Keys 1, 2, 2, 6, 5

Set the hysteresis band for the flow limit to determine how quickly the transmitter comes out of Alert status. This hysteresis value is used for both Flow Limit 1 and Flow Limit 2.

Flow Limit 2

375 Fast Keys 1, 2, 2, 7

AUX. FUNCTION

LOI Key

Configure the Parameters that will determine the criteria for activating a HART alert if the measured flow rate falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

Control 2

375 Fast Keys 1, 2, 7, 1

Turns the Flow Limit 2 HART Alert ON or OFF.

ON – The transmitter will generate a HART alert when the defined conditions are met.

OFF – The transmitter will not generate a HART alert for the Flow Limit 2.
Mode 2

| 375 Fast Keys | 1, 2, 2, 7, 2 |

Mode that determines when the Flow Limit 2 HART Alert will activate.

> High Limit – The HART Alert will activate when the measured flow rate exceeds the High Limit 2 set point.

< Low Limit – The HART Alert will activate when the measured flow rate falls below the Low Limit 2 set point.

In Range – The HART Alert will activate when the measured flow rate is between the High Limit 2 and Low Limit 2 set points.

Out of Range – The HART Alert will activate when the measured flow rate exceeds the High Limit 2 set point or falls below the Low Limit 2 set point.

High Limit 2

| 375 Fast Keys | 1, 2, 2, 7, 3 |

Set the flow rate value that corresponds to the high limit set point for the Flow Limit 2 alert.

Low Limit 2

| 375 Fast Keys | 1, 2, 2, 7, 4 |

Set the flow rate value that corresponds to the low limit set point for the Flow Limit 2 alert.

Flow Limit Hysteresis

| 375 Fast Keys | 1, 2, 2, 7, 5 |

Set the hysteresis band for the flow limit to determine how quickly the transmitter comes out of Alert status. This hysteresis value is used for both Flow Limit 1 and Flow Limit 2.

Total Limit

| 375 Fast Keys | 1, 2, 8 |

Configure the Parameters that will determine the criteria for activating a HART alert if the measured net total falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

Total Control

| 375 Fast Keys | 1, 2, 8, 1 |

Turns the Total Limit HART Alert ON or OFF.

ON – The transmitter will generate a HART alert when the defined conditions are met.

OFF – The transmitter will not generate a HART alert for the Total Limit.
Total Mode

| 375 Fast Keys | 1, 2, 8, 2 |

Mode that determines when the Total Limit HART Alert will activate.

- **> High Limit** – The HART Alert will activate when the measured net total exceeds the Total High Limit set point.
- **< Low Limit** – The HART Alert will activate when the measured net total falls below the Total Low Limit set point.
- **In Range** – The HART Alert will activate when the measured net total is between the Total High Limit and Total Low Limit set points.
- **Out of Range** – The HART Alert will activate when the measured net total exceeds the Total High Limit set point or falls below the Total Low Limit set point.

Total High Limit

| 375 Fast Keys | 1, 2, 8, 3 |

Set the net total value that corresponds to the high limit set point for the Flow Limit 1 alert.

Total Low Limit

| 375 Fast Keys | 1, 2, 8, 4 |

Set the net total value that corresponds to the low limit set point for the Flow Limit 1 alert.

Total Limit Hysteresis

| 375 Fast Keys | 1, 2, 8, 5 |

Set the hysteresis band for the total limit to determine how quickly the transmitter comes out of Alert status.

Advanced Diagnostics

| 375 Fast Keys | 1, 2, 3 |

The advanced diagnostics menu contains information on all of the additional diagnostics and tests that are available in the 8750WA12 transmitter if one of the diagnostics suite packages was ordered.

Rosemount offers two advanced diagnostic suites. Functionality under this menu will depend on which of these suites are ordered.

Advanced diagnostics suite option one (DA1 option) contains advanced diagnostics for High Process Noise detection and Grounding and Wiring fault detection.

Advanced diagnostics suite option two (DA2 option) contains advanced diagnostics for the 8714i Meter Verification. This diagnostic is used to verify the accuracy and performance of the magnetic flowmeter installation.

8714i Meter Verification

| 375 Fast Keys | 1, 2, 3, 1 |

This diagnostic verifies that the sensor, transmitter, or both are working within specifications. For more details on this diagnostic, see Appendix C: "Diagnostics".
Run 8714i

Run the meter verification test to check the transmitter, sensor, or entire installation.

**Full Meter Verification**

Run the internal meter verification to check the entire installation, sensor and transmitter at the same time.

**Transmitter Only**

Run the internal meter verification to check the transmitter only.

**Sensor Only**

Run the internal meter verification to check the sensor only.

**8714i Results**

Review the results of the most recently performed 8714i Meter Verification test. Information in this section details the measurements taken and if the meter passed the verification test. For more details on these results and what they mean, see Appendix C: "Diagnostics".

**Test Condition**

Displays the conditions that the 8714i Meter Verification test was performed under. For more details on this parameter see Appendix C: "Diagnostics".

**Test Criteria**

Displays the criteria that the 8714i Meter Verification test was performed against. For more details on this parameter see Appendix C: "Diagnostics".

**8714i Test Result**

Displays the results of the 8714i Meter Verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

**Simulated Velocity**

Displays the test velocity used to verify transmitter calibration. For more details on this parameter see Appendix C: "Diagnostics".

**Actual Velocity**

Displays the velocity measured by the transmitter during the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".
**Velocity Deviation**

375 Fast Keys 1, 2, 3, 1, 2, 6

Displays the deviation of the transmitter calibration verification test. For more details on this parameter see Appendix C: “Diagnostics”.

**Transmitter Calibration Test Result**

375 Fast Keys 1, 2, 3, 1, 2, 7

Displays the result of the transmitter calibration verification test as pass or fail. For more details on this parameter see Appendix C: “Diagnostics”.

**Sensor Calibration Deviation**

375 Fast Keys 1, 2, 3, 1, 2, 8

Displays the deviation of the sensor calibration verification test. For more details on this parameter see Appendix C: “Diagnostics”.

**Sensor Calibration Test Result**

375 Fast Keys 1, 2, 3, 1, 2, 9

Displays the result of the sensor calibration verification test as pass or fail. For more details on this parameter see Appendix C: “Diagnostics”.

**Coil Circuit Test Result**

375 Fast Keys 1, 2, 3, 1, 2, 10

Displays the result of the coil circuit test as pass or fail. For more details on this parameter see Appendix C: “Diagnostics”.

**Electrode Circuit Test Result**

375 Fast Keys 1, 2, 3, 1, 2, 11

Displays the result of the electrode circuit test as pass or fail. For more details on this parameter see Appendix C: “Diagnostics”.

**NOTE**

To access the coil circuit test result and electrode circuit test result, you must scroll to this option in the HART Field Communicator.

**Sensor Signature**

375 Fast Keys 1, 2, 3, 1, 3

LOI Key AUX. FUNCTION

The sensor signature describes the sensor characteristics to the transmitter and is an integral part of the sensor meter verification test. From this menu you can view the current stored signature, have the transmitter take and store the sensor signature, or re-call the last saved good values for the sensor signature. For more details on this parameter see Appendix C: “Diagnostics”.

**Signature Values**

375 Fast Keys 1, 2, 3, 1, 3, 1

LOI Key XMTR INFO

Review the current values stored for the sensor signature. For more details on this parameter see Appendix C: "Diagnostics".
Coil Resistance
375 Fast Keys  1, 2, 3, 1, 3, 1, 1
View the base line value for the coil resistance taken during the sensor signature process.

Coil Signature
375 Fast Keys  1, 2, 3, 1, 3, 1, 2
View the base line value for the coil signature taken during the sensor signature process.

Electrode Resistance
375 Fast Keys  1, 2, 3, 1, 3, 1, 3
View the base line value for the electrode resistance taken during the sensor signature process.

Re-Signature Meter
375 Fast Keys  1, 2, 3, 1, 3, 2
LOI Key  AUX. FUNCTION
Have the transmitter measure and store the sensor signature values. These values will then be used as the baseline for the meter verification test. Use this when connecting to older Rosemount or another manufacturers sensors, or installing the magnetic flowmeter system for the first time. For more details on this parameter see Appendix C: "Diagnostics".

Recall Last Saved Values
375 Fast Keys  1, 2, 3, 1, 3, 3
LOI Key  AUX. FUNCTION
Recalls the last saved “good” values for the sensor signature.

Set Pass/Fail Criteria
375 Fast Keys  1, 2, 3, 1, 4
LOI Key  AUX. FUNCTION
Set the maximum allowable deviation percentage test criteria for the 8714i Meter Verification test. There are three tests that this criteria can be set for:

- Full Pipe; No Flow (Best test condition) – Default is 2%
- Full Pipe; Flowing – Default is 3%
- Empty Pipe – Default is 5%

NOTE
If the 8714i Meter Verification test is done with an empty pipe, the electrode circuit will NOT be tested.

No Flow Limit
375 Fast Keys  1, 2, 3, 1, 4, 1
1 to 10 percent
Set the pass/fail test criteria for the 8714i Meter Verification test at Full Pipe, No Flow conditions.

Flowing Limit
375 Fast Keys  1, 2, 3, 1, 4, 2
1 to 10 percent
Set the pass/fail test criteria for the 8714i Meter Verification test at Full Pipe, Flowing conditions.
Empty Pipe Limit

1 to 10 percent
Set the pass/fail test criteria for the 8714i Meter Verification test at Empty Pipe conditions.

Measurements

Coil Resistance

View the measured value for the coil resistance taken during the 8714i meter verification test.

Coil Signature

View the measured value for the coil signature taken during the 8714i meter verification test.

Electrode Resistance

View the measured value for the electrode resistance taken during the 8714i meter verification test.

Licensing

If a diagnostic suite was not ordered initially, advanced diagnostics can be licensed in the field. Access the licensing information from this menu. For more details on licensing, see Appendix C: “Diagnostics”.

License Status

Determine if a diagnostics suite has been licensed, and if so, which diagnostics are available for activation.

License Key

A license key is required to activate diagnostics in the field if the diagnostic suite was not initially ordered. This menu allows for gathering of necessary data to generate a license key and also the ability to enter the license key once it has been received.

Device ID

This function displays the Device ID and Software Revision for the transmitter. Both of these pieces of information are required to generate a license key.
License Key

| 375 Fast Keys | 1, 2, 3, 2, 2 |

Allows you to enter a license key to activate a diagnostic suite.

From this menu, all of the diagnostic variable values can be reviewed. This information can be used to get more information about the transmitter, sensor, and process, or to get more detail about an alert that may have activated.

Empty Pipe Value

| 375 Fast Keys | 1, 2, 4, 1 |

Read the current value of the Empty Pipe parameter. This value will read zero if Empty Pipe is turned off.

Electronics Temperature

| 375 Fast Keys | 1, 2, 4, 2 |

Read the current value of the Electronics Temperature.

Line Noise

| 375 Fast Keys | 1, 2, 4, 3 |

Read the current value of the amplitude of AC line noise measured on the transmitter’s electrode inputs. This value is used in the grounding / wiring diagnostic. If the DA1 Diagnostic Suite was not ordered or licensed, the value displayed will be NA.

5 Hz Signal to Noise Ratio

| 375 Fast Keys | 1, 2, 4, 4 |

Read the current value of the signal to noise ratio at 5 Hz. For optimum performance, a value greater than 50 is preferred. Values less than 25 will cause the High Process Noise alert to activate. If the DA1 Diagnostic Suite was not ordered or licensed, the value displayed will be NA.

37 Hz Signal to Noise Ratio

| 375 Fast Keys | 1, 2, 4, 5 |

Read the current value of the signal to noise ratio at 37.5 Hz. For optimum performance, a value greater than 50 is preferred. Values less than 25 will cause the High Process Noise alert to activate. If the DA1 Diagnostic Suite was not ordered or licensed, the value displayed will be NA.

Signal Power

| 375 Fast Keys | 1, 2, 4, 6 |

Read the current value of the velocity of the fluid through the sensor. Higher velocities result in greater signal power. If the DA1 Diagnostic Suite was not ordered or licensed, the value displayed will be NA.

8714i Results

| 375 Fast Keys | 1, 2, 4, 7 |

Review the results of the 8714i Meter Verification tests. For more details on these results and what they mean, see Appendix C: "Diagnostics".

Test Condition

| 375 Fast Keys | 1, 2, 3, 7, 1 |

Displays the conditions that the 8714i Meter Verification test was performed under. For more details on this parameter see Appendix C: "Diagnostics".
Test Criteria

375 Fast Keys | 1, 2, 3, 7, 2

Displays the criteria that the 8714i Meter Verification test was performed against. For more details on this parameter see Appendix C: "Diagnostics".

8714i Test Result

375 Fast Keys | 1, 2, 3, 7, 3

Displays the results of the 8714i Meter Verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Simulated Velocity

375 Fast Keys | 1, 2, 3, 7, 4

Displays the test velocity used to verify transmitter calibration. For more details on this parameter see Appendix C: "Diagnostics".

Actual Velocity

375 Fast Keys | 1, 2, 3, 7, 5

Displays the velocity measured by the transmitter during the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Velocity Deviation

375 Fast Keys | 1, 2, 3, 7, 6

Displays the deviation of the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Transmitter Verification Test Result

375 Fast Keys | 1, 2, 3, 7, 7

Displays the result of the transmitter calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Sensor Verification Deviation

375 Fast Keys | 1, 2, 3, 7, 8

Displays the deviation of the sensor calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Sensor Verification Result

375 Fast Keys | 1, 2, 3, 7, 9

Displays the result of the sensor calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Coil Circuit Test Result

375 Fast Keys | 1, 2, 3, 7, 10

Displays the result of the coil circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Electrode Circuit Test Result

375 Fast Keys | 1, 2, 3, 7, 11

Displays the result of the electrode circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".
Trims

Trims are used to calibrate the analog loop, calibrate the transmitter, and re-zero the transmitter. Proceed with caution whenever performing a trim function.

D/A Trim

The D/ATrim is used to calibrate the 4-20 mA analog loop output from the transmitter. For maximum accuracy, the analog output should be trimmed for the loop. Use the following steps to complete the Output Trim function:

1. Set the loop to manual, if necessary.
2. Connect a precision ammeter in the 4–20 mA loop.
3. Initialize the D/A Trim function with the LOI or Handheld Communicator.
4. Enter the 4 mA meter value when prompted to do so.
5. Enter the 20 mA meter value when prompted to do so.
6. Return the loop to automatic control, if necessary.

The 4–20 mA trim is now complete. You may repeat the 4–20 mA trim to check the results, or use the analog output test.

Scaled D/A Trim

Scaled D/A trim calibration of the flowmeter analog output using a different scale than the standard 4-20 mA output scale. Non-scaled D/A trimming (described above), is typically performed using an ammeter where calibration values are entered in units of milliamperes. Scaled D/A trimming allows trimming of the flowmeter using a scale that may be more convenient based upon the method of measurement.

For example, it may be more convenient to make current measurements by direct voltage readings across the loop resistor. If the loop resistor is 500 ohms, and calibration of the meter using voltage measurements made across this resistor is desired, rescale the trim points from 4-20mA to 4-20mA x 500 ohm or 2-10 VDC. Once the scaled trim points have been entered as 2 and 10, calibration of the flowmeter can be done by entering voltage measurements directly from the voltmeter.
Digital Trim

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 2, 5, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>AUX. FUNCTION</td>
</tr>
</tbody>
</table>

Digital trim is the function by which the factory calibrates the transmitter. This procedure is rarely needed by users. It is only necessary if it is suspected the Rosemount 8750WA12 is no longer accurate. A Rosemount 8714 Calibration Standard is required to complete a digital trim. Attempting a digital trim without a Rosemount 8714 Calibration Standard may result in an inaccurate transmitter or an error message. The Digital Trim must be performed only with the coil drive mode set to 5 Hz and with a nominal sensor calibration number stored in the memory.

**NOTE**

Attempting a digital trim without a Rosemount 8714 Calibration Standard may result in an inaccurate transmitter, or a “DIGITAL TRIM FAILURE” message may appear. If this message occurs, no values were changed in the transmitter. Simply power down the Rosemount 8750WA12 to clear the message.

To simulate a nominal sensor with the Rosemount 8714D Calibration Standard, you must change the following four parameters in the Rosemount 8750WA12:

1. Calibration Number—1000015010000000
2. Units—ft/s
3. PV URV—20 mA = 30.00 ft/s
4. PV LRV—4 mA = 0 ft/s
5. Coil Drive Frequency—5 Hz

The instructions for changing the Sensor Calibration Number, Units, PV URV, and PV LRV are located in “Basic Setup” on page 3-8. Instructions for changing the Coil Drive Frequency can be found on page 5-16 in this section. Set the loop to manual, if necessary, before you begin. Complete the following steps:

1. Power down the transmitter.
2. Connect the transmitter to a Rosemount 8714 Calibration Standard.
3. Power up the transmitter with the Rosemount 8714 Calibration Standard connected and read the flow rate. The electronics need about a 5-minute warm-up time to stabilize.
4. Set the 8714 Calibration Standard to the 30 ft/s (9.1 m/s) setting.
5. The flow rate reading after warm-up should be between 29.97 (9.1 m/s) and 30.03 ft/s (9.2 m/s).
6. If the reading is within the range, return the transmitter to the original configuration parameters.
7. If the reading is not within this range, initiate a digital trim with the LOI or Handheld Communicator. The digital trim takes about 90 seconds to complete. No transmitter adjustments are required.
Auto Zero

The auto zero function initializes the transmitter for use with the 37 Hz coil drive mode only. Run this function only with the transmitter and sensor installed in the process. The sensor must be filled with process fluid at zero flow. Before running the auto zero function, be sure the coil drive mode is set to 37 Hz (Auto Zero will not run with the coil drive frequency set at 5 Hz).

Set the loop to manual if necessary and begin the auto zero procedure. The transmitter completes the procedure automatically in about 90 seconds. A symbol appears in the lower right-hand corner of the display to indicate that the procedure is running.

Status

Status displays a summary of the health of the transmitter. If there are any alerts or error messages that have activated, they will be listed here.

ADVANCED CONFIGURATION

In addition to the basic configuration options and the diagnostic information and controls, the 8750WA12 has many advanced functions that can also be configured as required by the application.

DETAILED SETUP

The detailed setup function provides access to other parameters within the transmitter that can be configured such as coil drive frequency, output parameters, local display configuration, and other general information about the device.

Additional Parameters

The additional parameters menu provides a means to configure optional parameters within the 8750WA12 transmitter.

Coil Drive Frequency

Coil drive frequency allows pulse-rate selection of the sensor coils.

5 Hz

The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

37 Hz

If the process fluid causes a noisy or unstable output, increase the coil drive frequency to 37 Hz. If the 37 Hz mode is selected, perform the auto zero function.

Density Value

The density value is used to convert from a volumetric flow rate to a mass flow rate using the following equation:

\[ Q_m = Q_v \times \rho \]

Where:

\( Q_m \) is the mass flow rate
\( Q_v \) is the volumetric flow rate, and
\( \rho \) is the fluid density
PV Upper Sensor Limit (USL)

The PV USL is the maximum value that the 20 mA value can be set to. This is the upper measuring limit of the transmitter and sensor.

PV Lower Sensor Limit (LSL)

The PV LSL is the minimum value that the 4 mA value can be set to. This is the lower measuring limit of the transmitter and sensor.

PV Minimum Span

The PV minimum span is the minimum flow range that must separate the 4 mA and 20 mA set point values.

Configure Outputs

The configure outputs menu contains functionality to configure the more advanced features that control the analog, pulse, auxiliary, and totalizer outputs of the transmitter.

Analog Output

Under this function the advanced features of the analog output can be configured.

PV Upper Range Value (URV)

The upper range value (URV), or analog output range, is preset to 30 ft/s at the factory. The units that appear will be the same as those selected under the units parameter.

The URV (20 mA point) can be set for both forward or reverse flow rate. Flow in the forward direction is represented by positive values and flow in the reverse direction is represented by negative values. The URV can be any value from –39.3 ft/s to +39.3 ft/s (-12 m/s to +12 m/s), as long as it is at least 1 ft/s (0.3 m/s) from the lower range value (4 mA point). The URV can be set to a value less than the lower range value. This will cause the transmitter analog output to operate in reverse, with the current increasing for lower (or more negative) flow rates.

NOTE

Line size, special units, and density (for mass units only) must be selected prior to configuration of URV and LRV.

PV Lower Range Value (LRV)

The lower range value (LRV) is preset to 0 ft/s at the factory. The units that appear will be the same as those selected under the units parameter.
Reset the lower range value (LRV), or 4 mA point, to change the size of the range (or span) between the URV and LRV. Under normal circumstances, the LRV should be set to a value near the minimum expected flow rate to maximize resolution. The LRV must be between –39.3 ft/s to +39.3 ft/s (-12 m/s to +12 m/s).

**NOTE**
The LRV can be set to a value greater than the URV, which will cause the analog output to operate in reverse. In this mode, the analog output will increase with lower (more negative) flow rates.

Example

If the URV is greater than the LRV, the analog output will saturate at 3.9 mA when the flow rate falls below the selected 4 mA point. The minimum allowable span between the URV and LRV is 1 ft/s. Do not set the LRV within 1 ft/s (0.3 m/s) of the 20 mA point. For example, if the URV is set to 15.67 ft/s (4.8 m/s) and if the desired URV is greater than the LRV, then the highest allowable setting would be 14.67 ft/s (4.5 m/s). If the desired URV is less than the LRV, then the lowest allowable LRV would be 16.67 ft/s (5.1 m/s).

**NOTE**
Line size, special units, and density (for mass units only) must be selected prior to configuration of URV and LRV.

---

**PV Analog Output**

| 375 Fast Keys | 1, 4, 2, 1, 6 |

The PV analog output displays the current analog output value (mA) of the transmitter corresponding to the current measured flow rate.

**Analog Output Alarm Type**

| 375 Fast Keys | 1, 4, 2, 1, 6 |

The analog output alarm type displays the alarm mode the 8750WA12 is currently set for. This value is set by a switch on the electronics board. There are two available options for this setting:

- High
- Low

**Loop Test**

| 375 Fast Keys | 1, 4, 2, 1, 5 |

The loop test drives the transmitter output to a desired electrical current on terminals 7 and 8. This capability allows for verification of the entire current loop prior to start-up. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

**D/A Trim**

| 375 Fast Keys | 1, 4, 2, 1, 6 |

The D/A Trim is used to calibrate the 4-20 mA analog loop output from the transmitter. For maximum accuracy, the analog output should be trimmed for the loop. Use the following steps to complete the Output Trim function.
1. Set the loop to manual, if necessary.
2. Connect a precision ammeter in the 4–20 mA loop.
3. Initiate the Output Trim function with the LOI, Handheld Communicator, or AMS.
4. Enter the 4 mA meter value when prompted to do so.
5. Enter the 20 mA meter value when prompted to do so.
6. Return the loop to automatic control, if necessary.

The 4–20 mA trim is now completed. Repeat the 4–20 mA trim to check the results, or use the analog output test.

**Scaled D/A Trim**

Scaled D/A trim enables calibration of the flowmeter analog output using a different scale than the standard 4-20 mA output scale. Non-scaled D/A trimming (described above), is typically performed using an ammeter where calibration values are entered in units of milliamperes. Scaled D/A trimming allows you to trim the flowmeter using a scale that may be more convenient based upon the method of measurement.

For example, it may be more convenient to make current measurements by direct voltage readings across the loop resistor. If the loop resistor is 500 ohms, and calibration of the meter using voltage measurements made across this resistor is desired, rescale the trim points from 4-20mA to 4-20mA x 500 ohm or 2-10 VDC. Once the scaled trim points have been entered as 2 and 10, calibration of the flowmeter can be done by entering voltage measurements directly from the voltmeter.

**Alarm Level**

The alarm level allows configuration of the transmitter to preset values if an alarm occurs. There are two options:

- Rosemount Alarm and Saturation Values
- NAMUR-Compliant Alarm and Saturation Levels

**Table 5-1. Rosemount (Standard) Alarm and Saturation Values**

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.9 mA</td>
<td>≤ 3.75 mA</td>
</tr>
<tr>
<td>High</td>
<td>20.8 mA</td>
<td>≥ 22.6 mA</td>
</tr>
</tbody>
</table>

**Table 5-2. NAMUR-Compliant Alarm and Saturation Values**

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.8 mA</td>
<td>≤ 3.5 mA</td>
</tr>
<tr>
<td>High</td>
<td>20.5 mA</td>
<td>≥ 22.6 mA</td>
</tr>
</tbody>
</table>

**Pulse Output**

Under this function the pulse output of the 8750WA12 can be configured.
Pulse Scaling

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 2, 2, 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>PULSE OUTPUT SCALING</td>
</tr>
</tbody>
</table>

The transmitter may be commanded to supply a specified frequency between 1 pulse/day at 39.37 ft/sec (12 m/s) to 10,000 Hz at 1 ft/sec (0.3 m/s).

**NOTE**

Line size, special units, and density (for mass units only) must be selected prior to configuration of the Pulse Scaling factor.

The pulse output scaling equates one transistor switch closure pulse to a selectable number of volume units. The volume unit used for scaling pulse output is taken from the numerator of the configured flow units. For example, if gal/min had been chosen when selecting the flow rate unit, the volume unit displayed would be gallons.

**NOTE**

The pulse output scaling is designed to operate between 0 and 10,000 Hz. The minimum conversion factor value is found by dividing the minimum span (in units of volume per second) by 10,000 Hz.

When selecting pulse output scaling, remember that the maximum pulse rate is 10,000 Hz. With the 110 percent overrange capability, the absolute limit is 11,000 Hz. For example, if the Rosemount 8750WA12 to pulse every time 0.01 gallons pass through the sensor, and the flow rate is 10,000 gal/min, the 10,000 Hz full-scale limit will be exceeded:

\[
\frac{10,000 \text{ gal}}{1 \text{ min}} \times \frac{1 \text{ pulse}}{0.01 \text{ gal}} = 16666.7 \text{ Hz}
\]

The best choice for this parameter depends upon the required resolution, the number of digits in the totalizer, the extent of range required, and the maximum counter external frequency.

**NOTE**

For totalizing on the LOI, ten digits are available.

Pulse Width

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 2, 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>AUX. FUNCTION</td>
</tr>
</tbody>
</table>

The factory default pulse width is 0.5 ms.

The width, or duration, of the pulse width can be adjusted to match the requirements of different counters or controllers (see Figure 5-1 on page 5-21). These are typically lower frequency applications (< 1000 Hz). The transmitter will accept values from 0.1 ms to 650 ms.

For frequencies higher than 1000 Hz, it is recommended to set the pulse mode to 50% duty cycle.

If the pulse width is set too wide (more than 1/2 the period of the pulse) the transmitter will automatically default to a pulse width of 50% duty cycle.
Figure 5-1. Pulse Output

Example

If pulse width is set to 100 ms, the maximum output is 5 Hz; for a pulse width of 0.5 ms, the maximum output would be 1000 Hz (at the maximum frequency output there is a 50 percent duty cycle).

<table>
<thead>
<tr>
<th>PULSE WIDTH</th>
<th>MINIMUM PERIOD (50% duty cycle)</th>
<th>MAXIMUM FREQUENCY</th>
</tr>
</thead>
</table>
| 100 ms      | 200 ms                          | 1 Cycle
200 mS = 5 Hz |
| 0.5 ms      | 1.0 ms                          | 1 Cycle
1.0 mS = 1000 Hz |

To achieve the greatest maximum frequency output, set the pulse width to the lowest value that is consistent with the requirements of the pulse output power source, pulse driven external totalizer, or other peripheral equipment.

Example

The maximum flow rate is 10,000 gpm. Set the pulse output scaling such that the transmitter outputs 10,000 Hz at 10,000 gpm.

\[
Pulse \text{ Scaling} = \frac{\text{Flow Rate (gpm)}}{(60 \text{ s/min})(\text{Frequency})}
\]

\[
Pulse \text{ Scaling} = \frac{10,000 \text{ gpm}}{(60 \text{ s/min})(10,000 \text{ Hz})}
\]

\[
Pulse \text{ Scaling} = 0.0167 \text{ gal/pulse}
\]

\[
1 \text{ Pulse} = 0.0167 \text{ gallon}
\]

**NOTE**

Changes to pulse width are only required when there is a minimum pulse width required for external counters, relays, etc. If frequency generated by the transmitter requires a smaller pulse width than the pulse width selected, the transmitter will automatically go to 50% duty cycle.
Example

The external counter is ranged for 350 gpm and pulse is set for one gallon. Assuming the pulse width is 0.5 ms, the maximum frequency output is 5.833 Hz.

\[
\text{Frequency} = \frac{\text{Flow Rate (gpm)}}{(60 \text{ s/min})(\text{Pulse Scaling gal/pulse})}
\]

\[
\text{Frequency} = \frac{350 \text{ gpm}}{(60 \text{ s/min})(1 \text{ gal/pulse})}
\]

\[
\text{Frequency} = 5.833 \text{ Hz}
\]

Example

The upper range value (20 mA) is 3000 gpm. To obtain the highest resolution of the pulse output, 10,000 Hz is scaled to the full scale analog reading.

\[
\text{Pulse Scaling} = \frac{\text{Flow Rate (gpm)}}{(60 \text{ s/min})(\text{Frequency})}
\]

\[
= \frac{3000 \text{ gpm}}{(60 \text{ s/min})(10,000 \text{Hz})}
\]

\[
= 0.005 \text{ gal/pulse}
\]

\[
1 \text{ Pulse} = 0.005 \text{ gallon}
\]

Pulse Output Loop Test

375 Fast Keys 1, 4, 2, 2, 3

LOI Key AUX. FUNCTION

The Pulse Output Loop Test allows the transmitter to drive the frequency output at terminals 3 and 4 to a desired value. This capability allows checking of the auxiliary equipment prior to start-up. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

Digital Input / Digital Output

375 Fast Keys 1, 4, 2, 3

LOI Key AUX. FUNCTION

This menu is used to configure the optional digital input and digital output parameters of the 8750WA12 transmitter. Note that this configuration option is only active if the auxiliary output suite (option code AX) was ordered.

DI/DO 1

375 Fast Keys 1, 4, 2, 3, 1

Configure the auxiliary output channel 1. This controls the auxiliary channel 1 of the transmitter on terminals 9(+) and 10(-). Note that the transmitter must have been ordered with the auxiliary output option (Model Code AX) or have been licensed in the field in order to have access to this functionality.

Configure I/O 1

375 Fast Keys 1, 4, 2, 3, 1, 1

Configure channel 1 for either an Input or an Output.
Input – Channel 1 will be configured as a discrete input. Options are:

PZR – Positive Zero Return. When conditions are met to activate the input, the transmitter will force the output to zero flow.

Net Total Reset – When conditions are met to activate the input, the transmitter will reset the Net Total value to zero.

Output – Channel 1 will be configured as a discrete output. Options are:

Reverse Flow – The output will activate when the transmitter detects a reverse flow condition.

Zero Flow – The output will activate when a no flow condition is detected.

Transmitter Fault – The output will activate when a transmitter fault condition is detected.

Empty Pipe – The output will activate when the transmitter detects an empty pipe condition.

Flow Limit 1 – The output will activate when the transmitter measures a flow rate that meets the conditions established for the Flow Limit 1 Alert.

Flow Limit 2 – The output will activate when the transmitter measures a flow rate that meets the conditions established for the Flow Limit 2 Alert.

Diagnostic Status Alert – The output will activate when the transmitter detects a condition that meets the configured criteria of the Diagnostic Status Alert.

Total Limit – The output will activate when the transmitter net total value meets the conditions established for the Total Limit Alert.

**DIO 1 Control**

| 375 Fast Keys | \(1, 2, 3, 4, 5\) |

Displays the configuration for Channel 1 as either a discrete Input or Output.

**Digital Input 1**

| 375 Fast Keys | \(1, 2, 3, 4\) |

Displays what discrete input Channel 1 will be set to when the Control for Channel 1 is set to Input.

**Digital Output 1**

| 375 Fast Keys | \(1, 2, 3, 4\) |

Displays what discrete output Channel 1 will be set to when the Control for Channel 1 is set to Output.
Configure the digital output value here. This controls the digital output from the transmitter on terminals 16(+) and 20(-). Options are:

- Reverse Flow – The output will activate when the transmitter detects a reverse flow condition.
- Zero Flow – The output will activate when a no flow condition is detected.
- Transmitter Fault – The output will activate when a transmitter fault condition is detected.
- Empty Pipe – The output will activate when the transmitter detects an empty pipe condition.
- Flow Limit 1 – The output will activate when the transmitter measures a flow rate that meets the conditions established for the Flow Limit 1 Alert.
- Flow Limit 2 – The output will activate when the transmitter measures a flow rate that meets the conditions established for the Flow Limit 2 Alert.
- Diagnostic Status Alert – The output will activate when the transmitter detects a condition that meets the configured criteria of the Diagnostic Status Alert.
- Total Limit – The output will activate when the transmitter net total value meets the conditions established for the Total Limit Alert.

**Flow Limit 1**

Configure the Parameters that will determine the criteria for activating a HART alert if the measured flow rate falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

**Control 1**

Turns the Flow Limit 1 HART Alert ON or OFF.

- **ON** – The transmitter will generate a HART alert when the defined conditions are met.
- **OFF** – The transmitter will not generate a HART alert for the Flow Limit 1.

**Mode 1**

Mode that determines when the Flow Limit 1 HART Alert will activate.

- **> High Limit** – The HART Alert will activate when the measured flow rate exceeds the High Limit 1 set point.
- **< Low Limit** – The HART Alert will activate when the measured flow rate falls below the Low Limit 1 set point.
In Range – The HART Alert will activate when the measured flow rate is between the High Limit 1 and Low Limit 1 set points.

Out of Range – The HART Alert will activate when the measured flow rate exceeds the High Limit 1 set point or falls below the Low Limit 1 set point.

**High Limit 1**

Set the flow rate value that corresponds to the high limit set point for the Flow Limit 1 alert.

| 375 Fast Keys | 1, 4, 2, 3, 3 |

**Low Limit 1**

Set the flow rate value that corresponds to the low limit set point for the Flow Limit 1 alert.

| 375 Fast Keys | 1, 4, 2, 3, 4 |

**Flow Limit Hysteresis**

Set the hysteresis band for the flow limit to determine how quickly the transmitter comes out of Alert status. This hysteresis value is used for both Flow Limit 1 and Flow Limit 2.

| 375 Fast Keys | 1, 4, 2, 3, 5 |

**Flow Limit 2**

Configure the Parameters that will determine the criteria for activating a HART alert if the measured flow rate falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain flow conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

| 375 Fast Keys | 1, 4, 2, 3, 4 |

| LOI Key | AUX. FUNCTION |

**Control 2**

Turns the Flow Limit 2 HART Alert ON or OFF.

ON – The transmitter will generate a HART alert when the defined conditions are met.

OFF – The transmitter will not generate a HART alert for the Flow Limit 2.

| 375 Fast Keys | 1, 4, 2, 3, 4, 1 |

**Mode 2**

Mode that determines when the Flow Limit 2 HART Alert will activate.

> High Limit – The HART Alert will activate when the measured flow rate exceeds the High Limit 2 set point.

< Low Limit – The HART Alert will activate when the measured flow rate falls below the Low Limit 2 set point.

In Range – The HART Alert will activate when the measured flow rate is between the High Limit 2 and Low Limit 2 set points.

Out of Range – The HART Alert will activate when the measured flow rate exceeds the High Limit 2 set point or falls below the Low Limit 2 set point.

| 375 Fast Keys | 1, 4, 2, 3, 4, 2 |
High Limit 2

375 Fast Keys 1, 4, 2, 3, 4, 3

Set the flow rate value that corresponds to the high limit set point for the Flow Limit 2 alert.

Low Limit 2

375 Fast Keys 1, 4, 2, 3, 4, 4

Set the flow rate value that corresponds to the low limit set point for the Flow Limit 2 alert.

Flow Limit Hysteresis

375 Fast Keys 1, 4, 2, 3, 4, 5

Set the hysteresis band for the flow limit to determine how quickly the transmitter comes out of Alert status. This hysteresis value is used for both Flow Limit 1 and Flow Limit 2.

Total Limit

375 Fast Keys 1, 4, 2, 3, 5

Configure the Parameters that will determine the criteria for activating a HART alert if the measured net total falls within a set of configured criteria. This functionality can be used for operating simple batching operations or generating alerts when certain conditions are met. This parameter can be configured as a discrete output if the transmitter was ordered with auxiliary outputs enabled (option code AX), or if this functionality has been licensed in the field.

Total Control

375 Fast Keys 1, 4, 2, 3, 5, 1

Turns the Total Limit HART Alert ON or OFF.

ON – The transmitter will generate a HART alert when the defined conditions are met.

OFF – The transmitter will not generate a HART alert for the Total Limit.

Total Mode

375 Fast Keys 1, 4, 2, 3, 5, 2

Mode that determines when the Total Limit HART Alert will activate.

> High Limit – The HART Alert will activate when the measured net total exceeds the Total High Limit set point.

< Low Limit – The HART Alert will activate when the measured net total falls below the Total Low Limit set point.

In Range – The HART Alert will activate when the measured net total is between the Total High Limit and Total Low Limit set points.

Out of Range – The HART Alert will activate when the measured net total exceeds the Total High Limit set point or falls below the Total Low Limit set point.

Total High Limit

375 Fast Keys 1, 4, 2, 3, 5, 3

Set the net total value that corresponds to the high limit set point for the Limit alert.
### Total Low Limit

| 375 Fast Keys | 1, 4, 2, 3, 5, 4 |

Set the net total value that corresponds to the low limit set point for the Limit alert.

### Total Limit Hysteresis

| 375 Fast Keys | 1, 4, 2, 3, 5, 5 |

Set the hysteresis band for the total limit to determine how quickly the transmitter comes out of Alert status.

### Diagnostic Status Alert

| 375 Fast Keys | 1, 4, 2, 3, 6 |

| LOI Key | AUX. FUNCTION |

Turn ON / OFF the diagnostics that will cause this Alert to activate.

- **ON** – The Diagnostic Status Alert will activate when a transmitter detects a diagnostic designated as ON.
- **OFF** – The Diagnostic Status Alert will not activate when diagnostics designated as OFF are detected.

### Reverse Flow

| 375 Fast Keys | 1, 4, 2, 4 |

| LOI Key | AUX. FUNCTION |

Enable or disable the transmitter’s ability to read reverse flow.

Reverse Flow allows the transmitter to read negative flow. This may occur when flow in the pipe is going the negative direction, or when either electrode wires or coil wires are reversed. This also enables the totalizer to count in the reverse direction.

### Totalizer Setup

| 375 Fast Keys | 1, 4, 2, 5 |

| LOI Key | AUX. FUNCTION |

The totalizer setup menu allows for the viewing and configuration of the totalizer parameters.

### Totalizer Units

| 375 Fast Keys | 1, 4, 2, 5, 1 |

| LOI Key | AUX. FUNCTION |

Totalizer units allow for the configuration of the units that the totalized value will be displayed as. These units are independent of the flow units.

### Measured Gross Total

| 375 Fast Keys | 1, 4, 2, 5, 2 |

| LOI Key | TOTALIZE |

Measured gross total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset.

To reset the gross total value, change the line size. See “Line Size” on page 4-10 for details on how to change the line size.
Measured Net Total

375 Fast Keys 1, 4, 2, 5, 3
LOI Key TOTALIZE

Measured net total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset. When reverse flow is enabled, the net total represents the difference between the total flow in the forward direction less the total flow in the reverse direction.

Measured Reverse Total

375 Fast Keys 1, 4, 2, 5, 4
LOI Key TOTALIZE

Measured reverse total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter in the reverse direction since the totalizer was last reset. This value is only totalized when reverse flow is enabled.

Start Totalizer

375 Fast Keys 1, 4, 2, 5, 5
LOI Key START/STOP

Start totalizer starts the totalizer counting from its current value.

Stop Totalizer

375 Fast Keys 1, 4, 2, 5, 6
LOI Key START/STOP

Stop totalizer interrupts the totalizer count until it is restarted again. This feature is often used during pipe cleaning or other maintenance operations.

Reset Totalizer

375 Fast Keys 1, 4, 2, 5, 7
LOI Key READ/RESET

Reset totalizer resets the net totalizer value to zero. The totalizer must be stopped before resetting.

NOTE
The totalizer value is saved in the Non-Volatile memory of the electronics every three seconds. Should power to the transmitter be interrupted, the totalizer value will start at the last saved value when power is re-applied.

Alarm Level

375 Fast Keys 1, 4, 2, 6

The alarm level allows configuration of the transmitter to preset values if an alarm occurs. There are two options:

- Rosemount Alarm and Saturation Values
- NAMUR-Complaint Alarm and Saturation Levels

Table 5-3. Rosemount (Standard) Alarm and Saturation Values

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.9 mA</td>
<td>$\leq 3.75$ mA</td>
</tr>
<tr>
<td>High</td>
<td>20.8 mA</td>
<td>$\geq 22.6$ mA</td>
</tr>
</tbody>
</table>
Multidrop configuration refers to the connection of several flowmeters to a single communications transmission line. Communication occurs digitally between a HART-based communicator or control system and the flowmeters. Multidrop mode automatically deactivates the analog output of the flowmeters. Using the HART communications protocol, up to 15 transmitters can be connected on a single twisted pair of wires or over leased phone lines. The use of a multidrop installation requires consideration of the update rate necessary from each transmitter, the combination of transmitter models, and the length of the transmission line. Multidrop installations are not recommended where intrinsic safety is a requirement. Communication with the transmitters can be accomplished with commercially available Bell 202 modems and a host implementing the HART protocol. Each transmitter is identified by a unique address (1-15) and responds to the commands defined in the HART protocol.

### Variable Mapping

| 375 Fast Keys | 1, 4, 2, 7 |

Variable mapping allows configuration of the variables that are mapped to the tertiary and quaternary variables. The primary and secondary variables are fixed and cannot be configured.

- PV is configured for flow
- SV is configured for pulse

### Tertiary Variable

| 375 Fast Keys | 1, 4, 2, 7, 1 |

The tertiary variable maps the third variable of the transmitter. This variable is a HART only variable and can be read off of the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable are:

- Forward Gross
- Forward Net
- Reverse Gross
- Electronics Temp

---

**Table 5-4. NAMUR-Compliant Alarm and Saturation Values**

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.8 mA</td>
<td>≤3.5 mA</td>
</tr>
<tr>
<td>High</td>
<td>20.5 mA</td>
<td>≥22.6 mA</td>
</tr>
</tbody>
</table>
Quaternary Variable

The quaternary variable maps the fourth variable of the transmitter. This variable is a HART only variable and can be read off of the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable are:

- Forward Gross
- Forward Net
- Reverse Gross
- Electronics Temp

Polling Address

Poll Address sets the address for a multi-dropped meter. The poll address is used to identify each meter on the multi-drop line. Follow the on-screen instructions to set the address at a number from 1 to 15. To set or change the flowmeter address, establish communication with the selected Rosemount 8750WA12 in the loop.

NOTE

The Rosemount 8750WA12 is set to poll address zero at the factory, allowing it to operate in the standard point-to-point manner with a 4–20 mA output signal. To activate multidrop communication, the transmitter poll address must be changed to a number between 1 and 15. This change deactivates the 4–20 mA analog output, setting it to 4 mA, and disables the failure mode alarm signal.

Number of Request Preambles

This is the number of preambles required by the 8750WA12 for HART communications.

Number of Response Preambles

This is the number of preambles sent by the 8750WA12 in response to any host request.

Burst Mode

Burst Mode Configuration

The Rosemount 8750WA12 includes a burst mode function that broadcasts the primary variable or all dynamic variables approximately three to four times a second. The burst mode is a specialized function used in very specific applications. The burst mode function enables selection of the variables to broadcast while in the burst mode and to select the burst mode option.
The Burst Mode variable enables setting of the Burst Mode to the needs of the application. Options for the Burst Mode setting include:
- Off—Turns off the Burst Mode so that no data are broadcast on the loop.
- On—Turns Burst Mode on so that the data selected under Burst Option are broadcast over the loop.

Additional command options may appear that are reserved and do not apply to the Rosemount 8750WA12.

**Burst Option**

| 375 Fast Keys | 1, 4, 2, 7, 6 |

Burst option enables selection of the variables to broadcast over the transmitter burst. Choose one of the following options:
- PV—Selects the process variable for broadcast over the transmitter burst.
- Percent Range/Current—Selects the process variable as percent of range and analog output variables for broadcast over the transmitter burst.
- Process vars/crnt—Selects the process variables and analog output variables for broadcast over the transmitter burst.
- Dynamic Vars—Burst all dynamic variables in the transmitter.

**LOI Configuration**

| 375 Fast Keys | 1, 4, 3 |

The LOI (local operator interface) configuration contains functionality to configure the LOI outputs of the transmitter.

**Flowrate Display**

| 375 Fast Keys | 1, 4, 3, 2 |

This allows configuration of the items that the LOI will display when at the flow rate screen. There are five options available:
- Flow rate and % Span
- % Span and Net Total
- Flowrate and Net Total
- % Span and Gross Total
- Flowrate and Gross Total

**Totalizer Display**

| 375 Fast Keys | 1, 4, 3, 3 |

This allows configuration of the items that the LOI will display when in the totalizer screen. There are two options available:
- Forward Total and Reverse Total
- Net Total and Gross Total

**Signal Processing**

| 375 Fast Keys | 1, 4, 4 |

The 8750WA12 contains several advanced functions that can be used to stabilize erratic outputs caused by process noise. The signal processing menu contains this functionality.
Operating Mode

The Operating Mode should be used only when the signal is noisy and gives an unstable output. Filter mode automatically uses 37 Hz coil drive mode and activates signal processing at the factory set default values. When using filter mode, perform an auto zero with no flow and a full sensor. Either of the parameters, coil drive mode or signal processing, may still be changed individually. Turning Signal Processing off or changing the coil drive frequency to 5 Hz will automatically change the Operating Mode from filter mode to normal mode.

Manually Configure Digital Signal Processing (DSP)

The 8750WA12 transmitter includes digital signal processing capabilities that can be used to condition the output from the transmitter by enabling noise rejection. See Appendix D: "Digital Signal Processing" for a more information on the DSP functionality.

Enable/Disable DSP

When ON is selected, the Rosemount 8750WA12 output is derived using a running average of the individual flow inputs. Signal processing is a software algorithm that examines the quality of the electrode signal against user-specified tolerances. This average is updated at the rate of 10 samples per second with a coil drive frequency of 5 Hz, and 75 samples per second with a coil drive frequency of 37Hz. The three parameters that make up signal processing (number of samples, maximum percent limit, and time limit) are described below.

Samples

0 to 125 Samples

The number of samples function sets the amount of time that inputs are collected and used to calculate the average value. Each second is divided into tenths (1/10) with the number of samples equaling the number of 1/10 second increments used to calculate the average.

For example, a value of:

1 averages the inputs over the past 1/10 second
10 averages the inputs over the past 1 second
100 averages the inputs over the past 10 seconds
125 averages the inputs over the past 12.5 seconds

% Limit

0 to 100 Percent

The maximum percent limit is a tolerance band set up on either side of the running average. The percentage value refers to deviation from the running average. For example, if the running average is 100 gal/min, and a 2 percent maximum limit is selected, then the acceptable range is from 98 to 102 gal/min.
Values within the limit are accepted while values outside the limit are analyzed to determine if they are a noise spike or an actual flow change.

**Time Limit**

| 375 Fast Keys | 1, 4, 4, 2, 4 |

0 to 256 Seconds

The time limit parameter forces the output and running average values to the new value of an actual flow rate change that is outside the percent limit boundaries. It thereby limits response time to flow changes to the time limit value rather than the length of the running average.

For example, if the number of samples selected is 100, then the response time of the system is 10 seconds. In some cases this may be unacceptable. By setting the time limit, you can force the 8750WA12 to clear the value of the running average and re-establish the output and average at the new flow rate once the time limit has elapsed. This parameter limits the response time added to the loop. A suggested time limit value of two seconds is a good starting point for most applicable process fluids. The selected signal processing configuration may be turned ON or OFF to suit your needs.

**Coil Drive Frequency**

| 375 Fast Keys | 1, 4, 4, 3 |

Coil drive frequency allows pulse-rate selection of the sensor coils.

**5 Hz**

The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

**37 Hz**

If the process fluid causes a noisy or unstable output, increase the coil drive frequency to 37 Hz. If the 37 Hz mode is selected, perform the auto zero function with no flow and a full sensor.

**Low Flow Cutoff**

| 375 Fast Keys | 1, 4, 4, 4 |

Low flow cutoff sets the flow rate between 0.01 and 38.37 ft/s, below which the outputs are driven to zero flow. The units format for low flow cutoff cannot be changed. It is always displayed as feet per second regardless of the PV Units format selected. The low flow cutoff value applies to both forward and reverse flows.

**Primary Variable Damping**

| 375 Fast Keys | 1, 4, 4, 5 |

0 to 256 Seconds

Primary Variable Damping allows selection of a response time, in seconds, to a step change in flow rate. It is most often used to smooth fluctuations in output.
Device Info

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

Information variables are used for identification of Flowmeters in the field and to store information that may be useful in service situations. Information variables have no effect on flowmeter output or process variables.

**Manufacturer**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

Manufacturer is an informational variable provided by the factory. For the Rosemount 8750WA12, the Manufacturer is Rosemount.

**Tag**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

Tag is the quickest variable to identify and distinguish between flowmeters. Flowmeters can be tagged according to the requirements of your application. The tag may be up to eight characters long.

**Descriptor**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

Descriptor is a longer user-defined variable to assist with more specific identification of the particular flowmeter. It is usually used in multi-flowmeter environments and provides 16 characters.

**Message**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

The message variable provides an even longer user-defined variable for identification and other purposes. It provides 32 characters of information and is stored with the other configuration data.

**Date**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 5</th>

</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>XMTR INFO</td>
</tr>
</tbody>
</table>

Date is a user-defined variable that provides a place to save a date, typically used to store the last date that the transmitter configuration was changed.

**Device ID**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>AUX. FUNCTION</td>
</tr>
</tbody>
</table>

This function displays the Device ID of the transmitter. This is one piece of information required to generate a license code to enable diagnostics in the field.

**Sensor Serial Number**

<table>
<thead>
<tr>
<th>375 Fast Keys</th>
<th>1, 4, 6, 7</th>
</tr>
</thead>
</table>

The PV sensor serial number is the serial number of the sensor connected to the transmitter and can be stored in the transmitter configuration for future reference. The number provides easy identification if the sensor needs servicing or for other purposes.
Sensor Tag

Sensor Tag is the quickest and shortest way of identifying and distinguishing between sensors. Sensors can be tagged according to the requirements of your application. The tag may be up to eight characters long.

Write Protect

Write protect is a read-only informational variable that reflects the setting of the hardware security switch. If write protect is ON, configuration data is protected and cannot be changed from a HART-based communicator, the LOI, or control system. If write protect is OFF, configuration data may be changed using the communicator, LOI, or control system.

Revision Numbers

Revision numbers are fixed informational variables that provide the revision number for different elements of your HART Communicator and Rosemount 8750WA12. These revision numbers may be required when calling the factory for support. Revision numbers can only be changed at the factory and are provided for the following elements:

NOTE
To access these features, you must scroll to this option in the HART Field Communicator.

Universal Revision Number

Universal revision number – Designates the HART Universal Command specification to which the transmitter is designed to conform.

Field Device Revision Number

Field device revision number – Designates the revision for the Rosemount 8750WA12 specific command identification for HART compatibility.

Software Revision Number

This function displays the software revision number of the transmitter. This is one piece of information required to generate a license code to enable diagnostics in the field.

Final Assembly Number

Final Assembly Number – Factory set number that refers to the electronics of your flowmeter. The number is configured into the flowmeter for later reference.
Construction Materials

<table>
<thead>
<tr>
<th>Flange Type</th>
<th>Flange Material</th>
<th>Electrode Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>375 Fast Keys</td>
<td>1, 4, 6, 11</td>
<td>375 Fast Keys</td>
</tr>
<tr>
<td>LOI Key</td>
<td>XMT INFO</td>
<td>LOI Key</td>
</tr>
</tbody>
</table>

Construction materials contain information about the sensor that is connected to the transmitter. This information is configured into the transmitter for later reference. This information can be helpful when calling the factory for support.

**NOTE**

To access these features, you must scroll to this option in the HART Field Communicator.

Flange type enables selection of the flange pressure rating for the flowmeter system. This variable only needs to be changed if the sensor has been replaced. Options for this value are:

- 150# ANSI
- 300# ANSI
- Wafer
- Other

Flange material enables selection of the flange material for the magnetic transmitter system. This variable only needs to be changed if the sensor has been replaced. Options for this value are:

- Carbon Steel
- 304 Stainless Steel
- 316 Stainless Steel
- Wafer
- Other

Electrode type enables selection of the electrode type of the magnetic flowmeter system. This variable only needs to be changed if the electrodes or entire sensor assembly have been replaced. Options for this value are:

- Standard
- Std & Ground
- Bullet
- Other
Electrode Material enables selection of the electrode material for the magnetic flowmeter system. This variable only needs to be changed if the electrodes or entire sensor assembly have been replaced. Options for this value are:

- 316L SST
- Nickel Alloy 276 (UNS N10276)
- Other

Liner Material enables selection of the liner material for the attached sensor. This variable only needs to be changed if the sensor has been replaced. Options for this value are:

- PTFE
- Polyurethane
- Neoprene
- Other

(1) To access these features, you must scroll to this option in the HART Field Communicator.
INTRODUCTION

This section contains information for advanced configuration parameters and diagnostics.

The software configuration settings for the Rosemount 8750WA32 can be accessed through a HART-based communicator, Local Operator Interface (LOI), or through a control system. The software functions for the HART Communicator are described in detail in this section of the manual. It provides an overview and summary of communicator functions. For more complete instructions, see the communicator manual. Before operating the Rosemount 8750WA32 in an actual installation, you should review all of the factory set configuration data to ensure that they reflect the current application.

DIAGNOSTICS

Diagnostics are used to verify that the transmitter is functioning properly, to assist in troubleshooting, to identify potential causes of error messages, and to verify the health of the transmitter and sensor. Diagnostic tests can be initiated through the use of a HART-based communications device, the Local Operator Interface, or through the control system.

Rosemount offers several different diagnostic suites providing various functionality.

Standard diagnostics included with every Rosemount 8750WA32 transmitter are Empty Pipe detection, Electronics Temperature monitoring, Coil Fault detection, and various loop and transmitter tests.

Advanced diagnostics suite option one (DA1 option) contains advanced diagnostics for High Process Noise detection and Grounding and Wiring fault detection.

Advanced diagnostics suite option two (DA2 option) contains advanced diagnostics for the 8714i Meter Verification and 4-20 mA loop verification. These diagnostics are used to verify the accuracy and performance of the magnetic flowmeter installation.
Diagnostic Controls

The diagnostic controls menu provides a centralized location for enabling or disabling each of the diagnostics that are available. Note that for some diagnostics to be available, a diagnostics suite package is required.

Empty Pipe

Turn the empty pipe diagnostic on or off as required by the application. For more details on the empty pipe diagnostic, see Appendix C: "Diagnostics".

High Process Noise

Turn the high process noise diagnostic on or off as required by the application. For more details on the high process noise diagnostic, see Appendix C: "Diagnostics".

Grounding / Wiring

Turn the grounding / wiring diagnostic on or off as required by the application. For more details on the grounding / wiring diagnostic, see Appendix C: "Diagnostics".

Electronics Temperature

Turn the electronics temperature diagnostic on or off as required by the application. For more details on the electronics temperature diagnostic, see Appendix C: "Diagnostics".

Basic Diagnostics

The basic diagnostics menu contains all of the standard diagnostics and tests that are available in the 8750WA32 transmitter.

Self Test

The transmitter test initiates a series of diagnostic tests that are not performed continuously during normal operation. It performs the following tests:

- Display Test
- RAM e\(\text{Err}\)
- PROM e\(\text{Err}\)

During the entire test, all outputs respond to flow signal. The test requires about ten seconds to complete.

AO Loop Test

The AO Loop test will cause the transmitter to drive the analog output to a desired electrical current output on terminals 1 and 2. The actual loop current can be independently measured and compared against the desired level set in the transmitter. On the LOI, the test will end after five minutes if the transmitter is not returned to normal operation manually.

4 mA

Fix the analog loop current at 4 mA.
Fix the analog loop current at 20 mA.

Simulate Alarm

Send the analog output into an alarm mA value. Actual mA value depends on the alarm configuration.

- Rosemount Standard High Alarm – 22.6 mA
- Rosemount Standard Low Alarm – 3.75 mA
- Namur Compliant High Alarm – 22.6 mA
- Namur Compliant Low Alarm – 3.5 mA

Other

Fix the analog loop current to some other mA value between 3.5 mA and 23.0 mA.

This command cancels the analog loop test and returns the analog output back into normal operating mode.

Pulse Output Loop Test

The Pulse Output Loop Test will cause the transmitter to drive the frequency output at terminals 3 and 4 to a desired value. The actual pulse output can then be measured by auxiliary equipment and compared to the desired pulse output level set in the transmitter. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

Select Value

Set the value of the pulse output for the test to a value between 1 pulse/day to 10,000 Hz.

This command cancels the pulse output loop test and returns the pulse output back into normal operating mode.

Empty Pipe Limits

Empty Pipe allows you to view the current value and configure the diagnostic parameters. For more detail on this parameter see Appendix C: "Diagnostics".

Empty Pipe Value

Read the current Empty Pipe Value. This number is a unitless number and is calculated based on multiple installation and process variables. For more detail on this parameter see Appendix C: "Diagnostics".
Empty Pipe Trigger Level

Limits: 3 to 2000

Configure the threshold limit that the empty pipe value must exceed before the diagnostic alert activates. Default from the factory is set to 100. For more detail on this parameter see Appendix C: "Diagnostics".

Empty Pipe Counts

Limits: 5 to 50

Configure the number of consecutive times that the empty pipe value must exceed the empty pipe trigger level before the diagnostic alert activates. Counts are taken at 1.5 second intervals. Default from the factory is set to 5. For more detail on this parameter see Appendix C: "Diagnostics".

Electronics Temperature

Electronics Temperature allows you to view the current value for the electronics temperature.

Advanced Diagnostics

The advanced diagnostics menu contains information on all of the additional diagnostics and tests that are available in the 8750WA32 transmitter if one of the diagnostics suite packages was ordered.

Rosemount offers two advanced diagnostic suites. Functionality under this menu will depend on which of these suites are ordered.

Advanced diagnostics suite option one (DA1 option) contains advanced diagnostics for High Process Noise detection and Grounding and Wiring fault detection.

Advanced diagnostics suite option two (DA2 option) contains advanced diagnostics for the 8714i Meter Verification and 4-20 mA loop verification. These diagnostics are used to verify the accuracy and performance of the magnetic flowmeter installation.

8714i Meter Verification

This diagnostic verifies that the sensor, transmitter, or both are working within specifications. For more details on this diagnostic, see Appendix C: "Diagnostics".

Run 8714i Verification

Run the meter verification test to check the transmitter, sensor, or entire installation.

Full Meter Verification

Run the internal meter verification to check the entire installation, sensor and transmitter at the same time.
Transmitter Only

Run the internal meter verification to check the transmitter only.

Sensor Only

Run the internal meter verification to check the sensor only.

8714i Results

Review the results of the most recently performed 8714i Meter Verification test. Information in this section details the measurements taken and if the meter passed the verification test. For more details on these results and what they mean, see Appendix C: "Diagnostics".

Test Condition

Displays the conditions that the 8714i Meter Verification test was performed under. For more details on this parameter see Appendix C: "Diagnostics".

Test Criteria

Displays the criteria that the 8714i Meter Verification test was performed against. For more details on this parameter see Appendix C: "Diagnostics".

8714i Test Result

Displays the results of the 8714i Meter Verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Simulated Velocity

Displays the test velocity used to verify transmitter calibration. For more details on this parameter see Appendix C: "Diagnostics".

Actual Velocity

Displays the velocity measured by the transmitter during the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Velocity Deviation

Displays the deviation of the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Transmitter Calibration Test Result

Displays the result of the transmitter calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".
Sensor Calibration Deviation

Displays the deviation of the sensor calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Sensor Calibration Test Result

Displays the result of the sensor calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Coil Circuit Test Result

Displays the result of the coil circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Electrode Circuit Test Result

Displays the result of the electrode circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

NOTE
To access the coil circuit test result and electrode circuit test result, you must scroll to this option in the HART Field Communicator.

Sensor Signature

The sensor signature describes the sensor characteristics to the transmitter and is an integral part of the sensor meter verification test. From this menu you can view the current stored signature, have the transmitter take and store the sensor signature, or re-call the last saved good values for the sensor signature. For more details on this parameter see Appendix C: "Diagnostics".

Signature Values

Review the current values stored for the sensor signature. For more details on this parameter see Appendix C: "Diagnostics".

Coil Resistance

View the measured value for the coil resistance taken during the sensor signature process.

Coil Signature

View the measured value for the coil signature taken during the sensor signature process.

Electrode Resistance

View the measured value for the electrode resistance taken during the sensor signature process.
Re-Signature Meter

375 Fast Keys 1, 2, 3, 1, 3, 2

Have the transmitter measure and store the sensor signature values. These values will then be used as the baseline for the meter verification test. Use this when connecting to older Rosemount sensors, or installing the magnetic flowmeter system for the first time. For more details on this parameter see Appendix C: "Diagnostics".

Recall Last Saved Values

375 Fast Keys 1, 2, 3, 1, 3, 3

Recalls the last saved "good" values for the sensor signature.

Set Pass/Fail Criteria

375 Fast Keys 1, 2, 3, 1, 4

Set the maximum allowable deviation percentage test criteria for the 8714i Meter Verification test. There are three tests that this criteria can be set for:

- Full Pipe; No Flow (Best test condition) – Default is 2%
- Full Pipe; Flowing – Default is 3%
- Empty Pipe – Default is 5%

NOTE

If the 8714i Meter Verification test is done with an empty pipe, the electrode circuit will NOT be tested.

No Flow Limit

375 Fast Keys 1, 2, 3, 1, 4, 1

1 to 10 percent

Set the pass/fail test criteria for the 8714i Meter Verification test at Full Pipe, No Flow conditions.

Flowing Limit

375 Fast Keys 1, 2, 3, 1, 4, 2

1 to 10 percent

Set the pass/fail test criteria for the 8714i Meter Verification test at Full Pipe, Flowing conditions.

Empty Pipe Limit

375 Fast Keys 1, 2, 3, 1, 4, 3

1 to 10 percent

Set the pass/fail test criteria for the 8714i Meter Verification test at Empty Pipe conditions.

Measurements

375 Fast Keys 1, 2, 3, 1, 5

View the measured values taken during the meter verification test. Values are shown for the Coil Resistance, Coil Signature, and Electrode Resistance.
Coil Resistance
375 Fast Keys 1, 2, 3, 1, 5, 1
View the measured value for the coil resistance taken during the 8714i meter verification test.

Coil Signature
375 Fast Keys 1, 2, 3, 1, 5, 2
View the measured value for the coil signature taken during the 8714i meter verification test.

Electrode Resistance
375 Fast Keys 1, 2, 3, 1, 5, 3
View the measured value for the electrode resistance taken during the 8714i meter verification test.

4-20 mA Verify
375 Fast Keys 1, 2, 3, 2
The 4-20 mA verify test is a diagnostic built into the transmitter to verify that the analog loop circuitry in the transmitter is functioning correctly. For more details on this diagnostic, see Appendix C: "Diagnostics".

4-20 mA Verification
375 Fast Keys 1, 2, 3, 2, 1
Run the 4-20 mA verification test to check the integrity of the analog loop.

4-20 mA Verify Results
375 Fast Keys 1, 2, 3, 2, 2
View the results of the 4-20 mA Loop Verification test.

Licensing
375 Fast Keys 1, 2, 3, 3
If a diagnostic suite was not ordered initially, advanced diagnostics can be licensed in the field. Access the licensing information from this menu. For more details on licensing, see Appendix C: "Diagnostics".

License Status
375 Fast Keys 1, 2, 3, 3, 1
Determine if a diagnostics suite has been licensed, and if so, which diagnostics are available for activation.

License Key
375 Fast Keys 1, 2, 3, 3, 2
A license key is required to activate diagnostics in the field if the diagnostic suite was not initially ordered. This menu allows for gathering of necessary data to generate a license key and also the ability to enter the license key once it has been received.

Device ID
375 Fast Keys 1, 2, 3, 3, 2, 1
This function displays the Device ID and Software Revision for the transmitter. Both of these pieces of information are required to generate a license key.
License Key

| 375 Fast Keys | 1, 2, 3, 3, 2, 2 |

Allows you to enter a license key to activate a diagnostic suite.

Diagnostic Variable Values

| 375 Fast Keys | 1, 2, 4 |

From this menu, all of the diagnostic variable values can be reviewed. This information can be used to get more information about the transmitter, sensor, and process, or to get more detail about an alert that may have activated.

Empty Pipe Value

| 375 Fast Keys | 1, 2, 4, 1 |

Read the current value of the Empty Pipe parameter. This value will read zero if Empty Pipe is turned off.

Electronics Temperature

| 375 Fast Keys | 1, 2, 4, 2 |

Read the current value of the Electronics Temperature.

Line Noise

| 375 Fast Keys | 1, 2, 4, 3 |

Read the current value of the amplitude of AC line noise measured on the transmitter’s electrode inputs. This value is used in the grounding / wiring diagnostic. If the DA1 Diagnostic suite was not licensed, the value displayed will be N/A.

5 Hz Signal to Noise Ratio

| 375 Fast Keys | 1, 2, 4, 4 |

Read the current value of the signal to noise ratio at 5 Hz. For optimum performance, a value greater than 50 is preferred. Values less than 25 will cause the High Process Noise alert to activate. If the DA1 Diagnostic suite was not licensed, the value displayed will be N/A.

37 Hz Signal to Noise Ratio

| 375 Fast Keys | 1, 2, 4, 5 |

Read the current value of the signal to noise ratio at 37.5 Hz. For optimum performance, a value greater than 50 is preferred. Values less than 25 will cause the High Process Noise alert to activate. If the DA1 Diagnostic suite was not licensed, the value displayed will be N/A.

Signal Power

| 375 Fast Keys | 1, 2, 4, 6 |

Read the current value of the velocity of the fluid through the sensor. Higher velocities result in greater signal power. If the DA1 Diagnostic suite was not licensed, the value displayed will be N/A.

8714i Results

| 375 Fast Keys | 1, 2, 4, 7 |

Review the results of the 8714i Meter Verification tests. For more details on these results and what they mean, see Appendix C: "Diagnostics".

Test Condition

| 375 Fast Keys | 1, 2, 3, 7, 1 |

Displays the conditions that the 8714i Meter Verification test was performed under. For more details on this parameter see Appendix C: "Diagnostics".
Test Criteria

| 375 Fast Keys | 1, 2, 3, 7, 2 |

Displays the criteria that the 8714i Meter Verification test was performed against. For more details on this parameter see Appendix C: "Diagnostics".

8714i Test Result

| 375 Fast Keys | 1, 2, 3, 7, 3 |

Displays the results of the 8714i Calibration Verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Simulated Velocity

| 375 Fast Keys | 1, 2, 3, 7, 4 |

Displays the test velocity used to verify transmitter calibration. For more details on this parameter see Appendix C: "Diagnostics".

Actual Velocity

| 375 Fast Keys | 1, 2, 3, 7, 5 |

Displays the velocity measured by the transmitter during the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Velocity Deviation

| 375 Fast Keys | 1, 2, 3, 7, 6 |

Displays the deviation of the transmitter calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Transmitter Verification Test Result

| 375 Fast Keys | 1, 2, 3, 7, 7 |

Displays the result of the transmitter calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Sensor Verification Deviation

| 375 Fast Keys | 1, 2, 3, 7, 8 |

Displays the deviation of the sensor calibration verification test. For more details on this parameter see Appendix C: "Diagnostics".

Sensor Verification Result

| 375 Fast Keys | 1, 2, 3, 7, 9 |

Displays the result of the sensor calibration verification test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Coil Circuit Test Result

| 375 Fast Keys | 1, 2, 3, 7, 10 |

Displays the result of the coil circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".

Electrode Circuit Test Result

| 375 Fast Keys | 1, 2, 3, 7, 11 |

Displays the result of the electrode circuit test as pass or fail. For more details on this parameter see Appendix C: "Diagnostics".
NOTE
To access the coil circuit test result and electrode circuit test result, you must scroll to this option in the HART Field Communicator.

Trims

Trims are used to calibrate the analog loop, calibrate the transmitter, and re-zero the transmitter. Proceed with caution whenever performing a trim function.

D/A Trim

The D/A Trim is used to calibrate the 4-20 mA analog loop output from the transmitter. For maximum accuracy, the analog output should be trimmed for the loop. Use the following steps to complete the Output Trim function.

1. Set the loop to manual, if necessary.
2. Connect a precision ammeter in the 4–20 mA loop.
3. Initiate the D/A Trim function with the LOI, Handheld Communicator, or AMS® Suite.
4. Enter the 4 mA meter value when prompted to do so.
5. Enter the 20 mA meter value when prompted to do so.
6. Return the loop to automatic control, if necessary.

The 4–20 mA trim is now complete. Repeat the 4–20 mA trim to check the results, or use the analog output test.

Scaled D/A Trim

Scaled D/A trim enables calibration of the flowmeter analog output using a different scale than the standard 4-20 mA output scale. Non-scaled D/A trimming (described above), is typically performed using an ammeter where calibration values are entered in units of milliamperes. Scaled D/A trimming allows trimming of the flowmeter using a scale that may be more convenient based upon the method of measurement.

For example, it may be more convenient to make current measurements by direct voltage readings across the loop resistor. If the loop resistor is 500 ohms, and calibration of the meter using voltage measurements made across this resistor is desired, rescale the trim points from 4-20mA to 4-20mA x 500 ohm or 2-10 VDC. Once the scaled trim points have been entered as 2 and 10, calibration of the flowmeter can be done by entering voltage measurements directly from the voltmeter.

Digital Trim

Digital trim is the function by which the factory calibrates the transmitter. This procedure is rarely needed by users. It is only necessary if you suspect the Rosemount 8750WA32 is no longer accurate. A Rosemount 8714 Calibration Standard is required to complete a digital trim. Attempting a digital trim without a Rosemount 8714 calibration standard may result in an inaccurate transmitter or an error message. The digital trim must be performed only with the coil drive mode set to 5 Hz and with a nominal sensor calibration number stored in the memory.
NOTE
Attempting a digital trim without a Rosemount 8714 calibration standard may result in an inaccurate transmitter, or a “DIGITAL TRIM FAILURE” message may appear. If this message occurs, no values were changed in the transmitter. Simply power down the Rosemount 8750WA32 to clear the message.

To simulate a nominal sensor with the Rosemount 8714 calibration standard, you must change the following four parameters in the Rosemount 8750WA32:

1. Sensor Calibration Number—1000015010000000
2. Units—ft/s
3. PV URV—20 mA = 30.00 ft/s
4. PV LRV—4 mA = 0 ft/s
5. Coil Drive Frequency—5 Hz

The instructions for changing the Tube Calibration Number, Units, PV URV, and PV LRV are located in “Basic Setup” on page 4-8. Instructions for changing the Coil Drive Frequency can be found on page 6-13 in this section.

Set the loop to manual, if necessary, before you begin. Complete the following steps:

1. Power down the transmitter.
2. Connect the transmitter to a Rosemount 8714 calibration standard.
3. Power up the transmitter with the Rosemount 8714 connected and read the flow rate. The electronics need about a 5-minute warm-up time to stabilize.
4. Set the 8714 calibration standard to the 30 ft/s (9.1 m/s) setting.
5. The flow rate reading after warm-up should be between 29.97 (9.1 m/s) and 30.03 ft/s (9.2 m/s).
6. If the reading is within the range, return the transmitter to the original configuration parameters.
7. If the reading is not within this range, initiate a digital trim with the LOI or Handheld Communicator. The digital trim takes about 90 seconds to complete. No transmitter adjustments are required.

Auto Zero

The auto zero function initializes the transmitter for use with the 37 Hz coil drive mode only. Run this function only with the transmitter and sensor installed in the process. The sensor must be filled with process fluid at zero flow. Before running the auto zero function, be sure the coil drive mode is set to 37 Hz (Auto Zero will not run with the coil drive frequency set at 5 Hz).

Set the loop to manual if necessary and begin the auto zero procedure. The transmitter completes the procedure automatically in about 90 seconds. A symbol appears in the lower right-hand corner of the display to indicate that the procedure is running.

Status

Status displays a summary of the health of the transmitter. If there are any alerts or error messages that have activated, they will be listed here.
ADVANCED CONFIGURATION

In addition to the basic configuration options and the diagnostic information and controls, the 8750WA32 has many advanced functions that can also be configured as required by the application.

DETAILED SETUP

The detailed setup function provides access to other parameters within the transmitter that can be configured such as coil drive frequency, output parameters, local display configuration, and other general information about the device.

Additional Parameters

The additional parameters menu provides a means to configure optional parameters within the 8750WA32 transmitter.

Coil Drive Frequency

Coil drive frequency allows pulse-rate selection of the sensor coils.

5 Hz

The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

37 Hz

If the process fluid causes a noisy or unstable output, increase the coil drive frequency to 37 Hz. If the 37 Hz mode is selected, perform the auto zero function.

Density Value

The density value is used to convert from a volumetric flow rate to a mass flow rate using the following equation:

\[ Q_m = Q_v \rho \]

Where:

- \( Q_m \) is the mass flow rate
- \( Q_v \) is the volumetric flow rate
- \( \rho \) is the fluid density

PV Upper Sensor Limit (USL)

The PV USL is the maximum value that the 20 mA value can be set to. This is the upper measuring limit of the transmitter and sensor.

PV Lower Sensor Limit (LSL)

The PV LSL is the minimum value that the 4 mA value can be set to. This is the lower measuring limit of the transmitter and sensor.

PV Minimum Span

The PV minimum span is the minimum flow range that must separate the 4 mA and 20 mA set point values.
Configure Outputs

The configure outputs menu contains functionality to configure the more advanced features that control the analog, pulse, auxiliary, and totalizer outputs of the transmitter.

Analog Output

Under this function the advanced features of the analog output can be configured.

**PV Upper Range Value (URV)**

The upper range value (URV), or analog output range, is preset to 30 ft/s at the factory. The units that appear will be the same as those selected under the units parameter.

The URV (20 mA point) can be set for both forward or reverse flow rate. Flow in the forward direction is represented by positive values and flow in the reverse direction is represented by negative values. The URV can be any value from –39.3 ft/s to +39.3 ft/s (-12 m/s to +12 m/s), as long as it is at least 1 ft/s (0.3 m/s) from the lower range value (4 mA point). The URV can be set to a value less than the lower range value. This will cause the transmitter analog output to operate in reverse, with the current increasing for lower (or more negative) flow rates.

**NOTE**

Line size, special units, and density (for mass units of measure only) must be selected prior to configuration of URV and LRV.

**PV Lower Range Value (LRV)**

Reset the lower range value (LRV), or 4 mA set point to change the size of the range (or span) between the URV and LRV. Under normal circumstances, the LRV should be set to a value near the minimum expected flow rate to maximize resolution. The LRV must be between –39.3 ft/s to +39.3 ft/s (-12 m/s to +12 m/s).

**NOTE**

The LRV can be set to a value greater than the URV, which will cause the analog output to operate in reverse. In this mode, the analog output will increase with lower (more negative) flow rates.

Example

If the URV is greater than the LRV, the analog output will saturate at 3.9 mA when the flow rate falls below the selected 4 mA point. The minimum allowable span between the URV and LRV is 1 ft/s. Do not set the LRV within 1 ft/s (0.3 m/s) of the 20 mA point. For example, if the URV is set to 15.67 ft/s (4.8 m/s) and if the desired URV is greater than the LRV, then the highest allowable LRV setting would be 14.67 ft/s (4.5 m/s). If the desired URV is less than the LRV, then the lowest allowable LRV would be 16.67 ft/s (5.1 m/s).
NOTE
Line size, special units, and density (for mass units of measure only) must be selected prior to configuration of URV and LRV.

PV Analog Output

The PV analog output displays the current analog output value (mA) of the transmitter corresponding to the current measured flow rate.

Analog Output Alarm Type

The analog output alarm type displays the alarm mode the 8750WA32 is currently set for. This value is set by a switch on the electronics board. There are two available options for this setting:

- High
- Low

Loop Test

The loop test drives the transmitter output to a desired electrical current on terminals 1 and 2. This capability allows for the verification of the entire current loop prior to start-up. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

D/A Trim

The D/A Trim is used to calibrate the 4–20 mA analog loop output from the transmitter. For maximum accuracy, the analog output should be trimmed for the system loop. Use the following steps to complete the Output Trim function.

1. Set the loop to manual, if necessary.
2. Connect a precision ammeter in the 4–20 mA loop.
3. Initiate the Output Trim function with the LOI, Handheld Communicator, or AMS® Suite.
4. Enter the 4 mA meter value when prompted to do so.
5. Enter the 20 mA meter value when prompted to do so.
6. Return the loop to automatic control, if necessary.

The 4–20 mA trim is now completed. You may repeat the 4–20 mA trim to check the results, or use the analog output test.

Scaled D/A Trim

Scaled D/A trim enables calibration of the flowmeter analog output using a different scale than the standard 4-20 mA output scale. Non-scaled D/A trimming (described above), is typically performed using an ammeter where calibration values are entered in units of milliamperes. Scaled D/A trimming allows you to trim the flowmeter using a scale that may be more convenient based upon the method of measurement.
For example, it may be more convenient to make current measurements by direct voltage readings across the loop resistor. If the loop resistor is 500 ohms, and calibration of the meter using voltage measurements made across this resistor is desired, rescale the trim points from 4-20mA to 4-20mA x 500 ohm or 2-10 VDC. Once the scaled trim points have been entered as 2 and 10, calibration of the flowmeter can be done by entering voltage measurements directly from the voltmeter.

**Alarm Level**

| 375 Fast Keys | 1, 4, 2, 1, 8 |

The alarm level allows you to drive the transmitter to preset values if an alarm occurs. There are two options:

- Rosemount Alarm and Saturation Values
- NAMUR-Compliant Alarm and Saturation Levels

**Table 6-1. Rosemount (Standard) Alarm and Saturation Values**

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.9 mA</td>
<td>≤ 3.75 mA</td>
</tr>
<tr>
<td>High</td>
<td>20.8 mA</td>
<td>≥ 22.6 mA</td>
</tr>
</tbody>
</table>

**Table 6-2. NAMUR-Compliant Alarm and Saturation Values**

<table>
<thead>
<tr>
<th>Level</th>
<th>4-20 mA Saturation</th>
<th>4-20 mA Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>3.8 mA</td>
<td>≤ 3.5 mA</td>
</tr>
<tr>
<td>High</td>
<td>20.5 mA</td>
<td>≥ 22.6 mA</td>
</tr>
</tbody>
</table>

**Pulse Output**

| 375 Fast Keys | 1, 4, 2, 2 |

Under this function the pulse output of the 8750WA32 can be configured.

**Pulse Scaling**

| 375 Fast Keys | 1, 4, 2, 2, 1 |

The transmitter may be commanded to supply a specified frequency between 1 pulse/day at 39.37 ft/sec (12 m/s) to 10,000 Hz at 1 ft/sec (0.3 m/s).

**NOTE**

Line size, special units, and density (for mass units of measure only) must be selected prior to configuration of the Pulse Scaling factor.

The pulse output scaling equates one transistor switch closure pulse to a selectable number of volume units. The volume unit used for scaling pulse output is taken from the numerator of the configured flow units. For example, if gal/min had been chosen when selecting the flow rate unit, the volume unit displayed would be gallons.

**NOTE**

The pulse output scaling is designed to operate between 0 and 10,000 Hz. The minimum conversion factor value is found by dividing the minimum span (in units of volume per second) by 10,000 Hz.
When selecting pulse output scaling, remember that the maximum pulse rate is 10,000 Hz. With the 110 percent overrange capability, the absolute limit is 11,000 Hz. For example, if the Rosemount 8750WA32 is scaled to pulse every time 0.01 gallons pass through the sensor, and the flow rate is 10,000 gal/min, the 10,000 Hz full-scale limit will be exceeded:

\[
\frac{10,000 \text{gal}}{1 \text{min}} \times \frac{1 \text{min}}{60 \text{sec}} \times \frac{1 \text{pulse}}{0.01 \text{gal}} = 16666.7 \text{Hz}
\]

The best choice for this parameter depends upon the required resolution, the number of digits in the totalizer, the extent of range required, and the maximum counter external frequency.

**NOTE**
For totalizing on the LOI, ten digits are available.

### Pulse Width

The factory default pulse width is 0.5 ms.

The width, or duration, of the pulse width can be adjusted to match the requirements of different counters or controllers (see Figure 6-1 on page 6-17). These are typically lower frequency applications (< 1000 Hz). The transmitter will accept values from 0.1 ms to 650 ms.

For frequencies higher than 1000 Hz, it is recommended to set the pulse mode to 50% duty cycle.

If the pulse width is set too wide (more than 1/2 the period of the pulse) the transmitter will automatically default to a pulse width of 50% duty cycle.

**Example**

If pulse width is set to 100 ms, the maximum output is 5 Hz; for a pulse width of 0.5 ms, the maximum output would be 1000 Hz (at the maximum frequency output there is a 50 percent duty cycle).

<table>
<thead>
<tr>
<th>PULSE WIDTH</th>
<th>MINIMUM PERIOD (50% duty cycle)</th>
<th>MAXIMUM FREQUENCY</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 ms</td>
<td>200 ms</td>
<td>1 Cycle  200 ms = 5 Hz</td>
</tr>
<tr>
<td>0.5 ms</td>
<td>1.0 ms</td>
<td>1 Cycle  1.0 ms = 1000 Hz</td>
</tr>
</tbody>
</table>

To achieve the greatest maximum frequency output, set the pulse width to the lowest value that is consistent with the requirements of the pulse output power source, pulse driven external totalizer, or other peripheral equipment.
Example

The maximum flow rate is 10,000 gpm. Set the pulse output scaling such that the transmitter outputs 10,000 Hz at 10,000 gpm.

\[
Pulse\ Scaling = \frac{Flow\ Rate\ (gpm)}{(60\ s/min)(Frequency)}
\]

\[
Pulse\ Scaling = \frac{10,000\ gpm}{(60\ s/min)(10,000\ Hz)}
\]

\[
Pulse\ Scaling = 0.0167\ gal/pulse
\]

1 Pulse = 0.0167 gallon

NOTE

Changes to pulse width are only required when there is a minimum pulse width required for external counters, relays, etc. If frequency generated by the transmitter requires a smaller pulse width than the pulse width selected, the transmitter will automatically go to 50% duty cycle.

Example

The external counter is ranged for 350 gpm and pulse is set for one gallon. Assuming the pulse width is 0.5 ms, the maximum frequency output is 5.833 Hz.

\[
Frequency = \frac{Flow\ Rate\ (gpm)}{(60\ s/min)(Pulse\ Scaling\ gal/pulse)}
\]

\[
Frequency = \frac{350\ gpm}{(60\ s/min)(1\ gal/pulse)}
\]

Frequency = 5.833 Hz

Example

The upper range value (20 mA) is 3000 gpm. To obtain the highest resolution of the pulse output, 10,000 Hz is scaled to the full scale analog reading.

\[
Pulse\ Scaling = \frac{Flow\ Rate\ (gpm)}{(60\ s/min)(Frequency)}
\]

\[
Pulse\ Scaling = \frac{3000\ gpm}{(60\ s/min)(10,000Hz)}
\]

\[
Pulse\ Scaling = 0.005\ gal/pulse
\]

1 Pulse = 0.005 gallon
### Pulse Mode

The Pulse mode configures the frequency output of the pulse. It can be set to either 50% duty cycle, or fixed. There are two options that Pulse Mode can be configured to:

- Pulse Output (User defines a fixed pulse width)
- Frequency Output (Pulse width automatically set to 50% duty cycle)

To use Pulse Width settings, Pulse Mode must be set to Pulse Output.

### Pulse Output Loop Test

The Pulse Output Loop Test allows the transmitter to drive the frequency output at terminals 3 and 4 to a desired value. This capability allows for checking of the auxiliary equipment prior to start-up. On the LOI the test will end after five minutes if the transmitter is not returned to normal operation manually.

### Digital Input / Digital Output

This menu is used to configure the optional digital input and digital output parameters of the 8750WA32 transmitter. Note that this configuration option is only active if the auxiliary output suite (option code AX) was ordered.

**Digital Input Channel 1**

Configure the digital input value here. This controls the digital input to the transmitter on terminals 5(-) and 6(+). There are two options that the digital input can be configured for:

- Positive Zero Return (PZR)
- Totalizer Reset

**Digital Output Channel 2**

Configure the digital output value here. This controls the digital output from the transmitter on terminals 7(-) and 8(+). There are four options that the digital output can be configured for:

- Zero Flow
- Reverse Flow
- Transmitter Fault
- Empty Pipe

### Reverse Flow

Enable or disable the transmitter’s ability to read reverse flow.

Reverse Flow allows the transmitter to read negative flow. This may occur when flow in the pipe is going the negative direction, or when either electrode wires or coil wires are reversed. This also enables the totalizer to count in the reverse direction.
Totalizer Setup

375 Fast Keys 1, 4, 2, 5

The totalizer setup menu allows for the viewing and configuration of the totalizer parameters.

Totalizer Units

375 Fast Keys 1, 4, 2, 5, 1

Totalizer units allow for the configuration of the units that the totalized value will be displayed as. These units are independent of the flow units.

Measured Gross Total

375 Fast Keys 1, 4, 2, 5, 2

Measured gross total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset.

To reset the gross total value, you must change the line size. See “Line Size” on page 3-9 for details on how to change the line size.

Measured Net Total

375 Fast Keys 1, 4, 2, 5, 3

Measured net total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter since the totalizer was last reset. When reverse flow is enabled, the net total represents the difference between the total flow in the forward direction less the total flow in the reverse direction.

Measured Reverse Total

375 Fast Keys 1, 4, 2, 5, 4

Measured reverse total provides the output reading of the totalizer. This value is the amount of process fluid that has passed through the flowmeter in the reverse direction since the totalizer was last reset. This value is only totalized when reverse flow is enabled.

Start Totalizer

375 Fast Keys 1, 4, 2, 5, 5

Start totalizer starts the totalizer counting from its current value.

Stop Totalizer

375 Fast Keys 1, 4, 2, 5, 6

Stop totalizer interrupts the totalizer count until it is restarted again. This feature is often used during pipe cleaning or other maintenance operations.

Reset Totalizer

375 Fast Keys 1, 4, 2, 5, 7

Reset totalizer resets the net totalizer value to zero. The totalizer must be stopped before resetting.

NOTE

The totalizer value is saved in the Non-Volatile memory of the electronics every three seconds. Should power to the transmitter be interrupted, the totalizer value will start at the last saved value when power is re-applied.
Alarm Level

- **375 Fast Keys**: 1, 4, 2, 6

The alarm level configures the transmitter to preset values if an alarm occurs. There are two options:

- Rosemount Alarm and Saturation Values
- NAMUR-Compliant Alarm and Saturation Levels

| Table 6-3. Rosemount (Standard) Alarm and Saturation Values |
|---------------------------------|-----------------|-----------------|
| Level  | 4-20 mA Saturation | 4-20 mA Alarm   |
| Low    | 3.9 mA             | ≤ 3.75 mA       |
| High   | 20.8 mA            | ≥ 22.6 mA       |

| Table 6-4. NAMUR-Compliant Alarm and Saturation Values |
|---------------------------------|-----------------|-----------------|
| Level  | 4-20 mA Saturation | 4-20 mA Alarm   |
| Low    | 3.8 mA             | ≤ 3.5 mA        |
| High   | 20.5 mA            | ≥ 22.6 mA       |

HART Output

- **375 Fast Keys**: 1, 4, 2, 7

Multidrop configuration refers to the connection of several flowmeters to a single communications transmission line. Communication occurs digitally between a HART-based communicator or control system and the flowmeters. Multidrop mode automatically deactivates the analog output of the flowmeters. Using the HART communications protocol, up to 15 transmitters can be connected on a single twisted pair of wires or over leased phone lines. The use of a multidrop installation requires consideration of the update rate necessary from each transmitter, the combination of transmitter models, and the length of the transmission line. Multidrop installations are not recommended where intrinsic safety is a requirement. Communication with the transmitters can be accomplished with commercially available Bell 202 modems and a host implementing the HART protocol. Each transmitter is identified by a unique address (1-15) and responds to the commands defined in the HART protocol.

Variable Mapping

- **375 Fast Keys**: 1, 4, 2, 7, 1

Variable mapping allows configuration of the variables that are mapped to the tertiary and quaternary variables. The primary and secondary variables are fixed and cannot be configured.

- PV is configured for flow
- SV is configured for pulse
Tertiary Variable

The tertiary variable maps the third variable of the transmitter. This variable is a HART only variable and can be read off of the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable are:

- Forward Gross
- Forward Net
- Reverse Gross
- Electronics Temp

Quaternary Variable

The quaternary variable maps the fourth variable of the transmitter. This variable is a HART only variable and can be read off of the HART signal with a HART enabled input card, or can be burst for use with a HART Tri-Loop to convert the HART signal to an analog output. Options available for mapping to this variable are:

- Forward Gross
- Forward Net
- Reverse Gross
- Electronics Temp

Polling Address

Poll Address enables you to set the poll address for a multi-dropped meter. The poll address is used to identify each meter on the multi-drop line. Follow the on-screen instructions to set the address at a number from 1 to 15. To set or change the flowmeter address, establish communication with the selected Rosemount 8750WA32 in the loop.

NOTE

The Rosemount 8750WA32 is set to poll address zero at the factory, allowing it to operate in the standard point-to-point manner with a 4–20 mA output signal. To activate multidrop communication, the transmitter poll address must be changed to a number between 1 and 15. This change deactivates the 4–20 mA analog output, setting it to 4 mA, and disables the failure mode alarm signal.

Number of Request Preambles

This is the number of preambles required by the 8750WA32 for HART communications.

Number of Response Preambles

This is the number of preambles sent by the 8750WA32 in response to any host request.
Burst Mode Configuration

The Rosemount 8750WA32 includes a burst mode function that broadcasts the primary variable or all dynamic variables approximately three to four times a second. The burst mode is a specialized function used in very specific applications. The burst mode function enables selection of the variables to broadcast while in the burst mode and to select the burst mode option.

The Burst Mode variable enables setting of the Burst Mode to the needs of the application. Options for the Burst Mode setting include:

- Off—Turns off the Burst Mode so that no data is broadcast on the loop.
- On—Turns Burst Mode on so that the data selected under Burst Option is broadcast over the loop.

Additional command options may appear that are reserved and do not apply to the Rosemount 8750WA32.

Burst Option

Burst option enables selection of the variables to broadcast over the transmitter burst. Choose one of the following options:

- PV—Selects the process variable for broadcast over the transmitter burst.
- Percent Range/Current—Selects the process variable as percent of range and analog output variables for broadcast over the transmitter burst.
- Process vars/crnt—Selects the process variables and analog output variables for broadcast over the transmitter burst.
- Dynamic Vars—Burst all dynamic variables in the transmitter.

LOI Configuration

The LOI (local operator interface) configuration contains functionality to configure the LOI outputs of the transmitter.

Language

This allows configuration of the display language shown on the LOI. There are five options available:

- English
- Spanish
- Portuguese
- German
- French
Flowrate Display

| 375 Fast Keys | 1, 4, 3, 2 |

This allows configuration of the items that the LOI will display when at the flowrate screen. There are five options available:

- Flow rate and % Span
- % Span and Net Total
- Flowrate and Net Total
- % Span and Gross Total
- Flowrate and Gross Total

Totalizer Display

| 375 Fast Keys | 1, 4, 3, 3 |

This allows configuration of the items that the LOI will display when in the totalizer screen. There are two options available:

- Forward Total and Reverse Total
- Net Total and Gross Total

Display Lock

| 375 Fast Keys | 1, 4, 3, 4 |

This allows for enabling or disabling of the display lock for the 8750WA32. Enabling the display lock will disable the operator interface keys to prevent inadvertent changes that may be caused by wiping the glass cover.

To lock/unlock the display, hold the UP ARROW on the LOI for 10 seconds. When display lock is active, an “L” will flash in the lower right-hand corner of the display.

Signal Processing

| 375 Fast Keys | 1, 4, 4 |

The 8750WA32 contains several advanced functions that can be used to stabilize erratic outputs caused by process noise. The signal processing menu contains this functionality.

Operating Mode

| 375 Fast Keys | 1, 4, 4, 1 |

The Operating Mode should be used only when the signal is noisy and gives an unstable output. Filter mode automatically uses 37 Hz coil drive mode and activates signal processing at the factory set default values. When using filter mode, perform an auto zero with no flow and a full sensor. Either of the parameters, coil drive mode or signal processing, may still be changed individually. Turning Signal Processing off or changing the coil drive frequency to 5 Hz will automatically change the Operating Mode from filter mode to normal mode.

Manually Configure Digital Signal Processing (DSP)

| 375 Fast Keys | 1, 4, 4, 2 |

The 8750WA32 transmitter includes digital signal processing capabilities that can be used to condition the output from the transmitter by enabling noise rejection. See Appendix D: "Digital Signal Processing" for more information on the DSP functionality.
When ON is selected, the Rosemount 8750WA32 output is derived using a running average of the individual flow inputs. Signal processing is a software algorithm that examines the quality of the electrode signal against user-specified tolerances. This average is updated at the rate of 10 samples per second with a coil drive frequency of 5 Hz, and 75 samples per second with a coil drive frequency of 37Hz. The three parameters that make up signal processing (number of samples, maximum percent limit, and time limit) are described below.

**Samples**

| 375 Fast Keys | 1, 4, 4, 2, 2 |

0 to 125 Samples

The number of samples function sets the amount of time that inputs are collected and used to calculate the average value. Each second is divided into tenths (1/10) with the number of samples equaling the number of 1/10 second increments used to calculate the average.

For example, a value of:

- 1 averages the inputs over the past 1/10 second
- 10 averages the inputs over the past 1 second
- 100 averages the inputs over the past 10 seconds
- 125 averages the inputs over the past 12.5 seconds

**% Limit**

| 375 Fast Keys | 1, 4, 4, 2, 3 |

0 to 100 Percent

The maximum percent limit is a tolerance band set up on either side of the running average. The percentage value refers to deviation from the running average. For example, if the running average is 100 gal/min, and a 2 percent maximum limit is selected, then the acceptable range is from 98 to 102 gal/min.

Values within the limit are accepted while values outside the limit are analyzed to determine if they are a noise spike or an actual flow change.

**Time Limit**

| 375 Fast Keys | 1, 4, 4, 2, 4 |

0 to 256 Seconds

The time limit parameter forces the output and running average values to the new value of an actual flow rate change that is outside the percent limit boundaries. It thereby limits response time to flow changes to the time limit value rather than the length of the running average.

For example, if the number of samples selected is 100, then the response time of the system is 10 seconds. In some cases this may be unacceptable. By setting the time limit, you can force the 8750WA32 to clear the value of the running average and re-establish the output and average at the new flow rate once the time limit has elapsed.
This parameter limits the response time added to the loop. A suggested time limit value of two seconds is a good starting point for most applicable process fluids. The selected signal processing configuration may be turned ON or OFF based on the needs of the application.

Coil Drive Frequency

Coil drive frequency allows pulse-rate selection of the sensor coils.

5 Hz

The standard coil drive frequency is 5 Hz, which is sufficient for nearly all applications.

37 Hz

If the process fluid causes a noisy or unstable output, increase the coil drive frequency to 37 Hz. If the 37 Hz mode is selected, perform the auto zero function with no flow and a full sensor.

Low Flow Cutoff

Low flow cutoff allows configuration of the flow rate, between 0.01 and 38.37 f/s, below which the outputs are driven to zero flow. The units format for low flow cutoff cannot be changed. It is always displayed as feet per second regardless of the PV Units format selected. The low flow cutoff value applies to both forward and reverse flows.

Primary Variable Damping

Primary Variable Damping allows selection of a response time, in seconds, to a step change in flow rate. It is most often used to smooth fluctuations in output.

Device Info

Information variables are used for identification of Flowmeters in the field and to store information that may be useful in service situations. Information variables have no effect on flowmeter output or process variables.

Manufacturer

Manufacturer is an informational variable provided by the factory. For the Rosemount 8750WA32, the Manufacturer is Rosemount.

Tag

Tag is the quickest variable to identify and distinguish between flowmeters. Flowmeters can be tagged according to the requirements of the application. The tag may be up to eight characters long.

Descriptor

Descriptor is a longer user-defined variable to assist with more specific identification of the particular flowmeter. It is usually used in multi-flowmeter environments and provides 16 characters.
Message

| 375 Fast Keys | 1, 4, 6, 4 |

The message variable provides an even longer user-defined variable for identification and other purposes. It provides 32 characters of information and is stored with the other configuration data.

Date

| 375 Fast Keys | 1, 4, 6, 5 |

Date is a user-defined variable that provides a place to save a date, typically used to store the last date that the transmitter configuration was changed.

Device ID

| 375 Fast Keys | 1, 4, 6, 6 |

This function displays the Device ID of the transmitter. This is one piece of information required to generate a license code to enable diagnostics in the field.

Sensor Serial Number

| 375 Fast Keys | 1, 4, 6, 7 |

The PV sensor serial number is the serial number of the sensor connected to the transmitter and can be stored in the transmitter configuration for future reference. The number provides easy identification if the sensor needs servicing or for other purposes.

Sensor Tag

| 375 Fast Keys | 1, 4, 6, 8 |

Sensor Tag is the quickest and shortest way of identifying and distinguishing between sensors. Sensors can be tagged according to the requirements of the application. The tag may be up to eight characters long.

Write Protect

| 375 Fast Keys | 1, 4, 6, 9 |

Write protect is a read-only informational variable that reflects the setting of the hardware security switch. If write protect is ON, configuration data is protected and cannot be changed from a HART-based communicator, the LOI, or control system. If write protect is OFF, configuration data may be changed using the communicator, LOI, or control system.

Revision Numbers

| 375 Fast Keys | 1, 4, 6, 10 |

Revisions numbers are fixed informational variables that provide the revision number for different elements of your HART Communicator and Rosemount 8750WA32. These revision numbers may be required when calling the factory for support. Revision numbers can only be changed at the factory and are provided for the following elements:

NOTE

To access these features, you must scroll to this option in the HART Field Communicator.
Universal Revision Number

| 375 Fast Keys 1, 4, 6, 10, 1 |

Designates the HART Universal Command specification to which the transmitter is designed to conform.

Field Device Revision Number

| 375 Fast Keys 1, 4, 6, 10, 2 |

Designates the revision for the Rosemount 8750WA32 specific command identification for HART compatibility.

Software Revision Number

| 375 Fast Keys 1, 4, 6, 10, 3 |

This function displays the software revision number of the transmitter. This is one piece of information required to generate a license code to enable diagnostics in the field.

Final Assembly Number

| 375 Fast Keys 1, 4, 6, 10, 4 |

A factory set number that refers to the electronics of your flowmeter. The number is configured into the flowmeter for later reference.

Construction Materials

| 375 Fast Keys 1, 4, 6, 11 |

Construction materials contain information about the sensor that is connected to the transmitter. This information is configured into the transmitter for later reference. This information can be helpful when calling the factory for support.

NOTE

To access these features, you must scroll to this option in the HART Field Communicator.

Flange Type

| 375 Fast Keys 1, 4, 6, 11, 1 |

Flange type enables selection of the flange type for your magnetic transmitter system. This variable only needs to be changed if you have changed your sensor. Options for this value are:

- 150# ANSI
- 300# ANSI
- Wafer
- Other
### Flange Material

| 375 Fast Keys | 1, 4, 6, 11, 2 |

Flange material enables selection of the flange material for your magnetic transmitter system. This variable only needs to be changed if you have changed your sensor. Options for this value are:

- Carbon Steel
- 304 Stainless Steel
- 316 Stainless Steel
- Wafer
- Other

### Electrode Type

| 375 Fast Keys | 1, 4, 6, 11, 3 |

Electrode type enables selection of the electrode type for your magnetic transmitter system. This variable only needs to be changed if you have replaced electrodes or if you have replaced your sensor. Options for this value are:

- Standard
- Std & Ground
- Bullet
- Other

### Electrode Material

| 375 Fast Keys | 1, 4, 6, 11, 4 |

Electrode Material enables selection of the electrode material for your magnetic transmitter system. This variable only needs to be changed if you have replaced electrodes or if you have replaced your sensor. Options for this value are:

- 316L SST
- Nickel Alloy C-276
- Other

### Liner Material

| 375 Fast Keys | 1, 4, 6, 11, 5 |

Liner material enables selection of the liner material for the attached sensor. This variable only needs to be changed if you have replaced your sensor. Options for this value are:

- PTFE
- Polyurethane
- Neoprene
- Other

To access these features, you must scroll to this option in the HART Field Communicator.
Section 7  Sensor Installation

This section covers the steps required to physically install the magnetic sensor. For electrical connections and cabling see Section 2: "Installation". Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please refer to the following safety messages before performing any operation in this section.

SAFETY MESSAGES

⚠️ This symbol is used throughout this manual to indicate that special attention to warning information is required.

⚠️ WARNING

Failure to follow these installation guidelines could result in death or serious injury:
Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified. Verify that the operating environment of the sensor and transmitter is consistent with the appropriate hazardous area approval.
Do not connect a Rosemount 8750WA to a non-Rosemount sensor that is located in an explosive atmosphere.

⚠️ WARNING

Explosions could result in death or serious injury:
Installation of this transmitter in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Please review the approvals section of the 8750WA12 reference manual for any restrictions associated with a safe installation.
Before connecting a HART-based communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
Electrical shock can result in death or serious injury
Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.
Handle all parts carefully to prevent damage. Whenever possible, transport the system to the installation site in the original shipping containers. PTFE-lined sensors are shipped with end covers that protect it from both mechanical damage and normal unrestrained distortion. Remove the end covers just before installation.

Flanged 6- through 36-inch sensors come with a lifting lug on each flange. The lifting lugs make the sensor easier to handle when it is transported and lowered into place at the installation site.

Flanged ½- to 4-inch sensors do not have lugs. They must be supported with a lifting sling on each side of the housing.

Figure 7-1 shows sensors correctly supported for handling and installation. Notice the plywood end pieces are still in place to protect the sensor liner during transportation.

See "Safety Messages" on pages 7-1 and 7-2 for complete warning information.
SENSOR MOUNTING

Physical mounting of a sensor is similar to installing a typical section of pipe. Conventional tools, equipment, and accessories (bolts, gaskets, and grounding hardware) are required.

Upstream/Downstream Piping

To ensure specification accuracy over widely varying process conditions, install the sensor a minimum of five straight pipe diameters upstream and two pipe diameters downstream from the electrode plane (see Figure 7-2).

Sensor Orientation

The sensor should be installed in a position that ensures the sensor remains full during operation. Figures 7-3, 7-4, and 7-5 show the proper sensor orientation for the most common installations. The following orientations ensure that the electrodes are in the optimum plane to minimize the effects of entrapped gas.

Vertical installation allows upward process fluid flow and is generally preferred. Upward flow keeps the cross-sectional area full, regardless of flow rate. Orientation of the electrode plane is unimportant in vertical installations. As illustrated in Figures 7-3 and 7-4, avoid downward flows where back pressure does not ensure that the sensor remains full at all times.
Installations with reduced straight runs from 0 to five pipe diameters are possible. In reduced straight pipe run installations, performance will shift to as much as 0.5% of rate. Reported flow rates will still be highly repeatable.

Horizontal installation should be restricted to low piping sections that are normally full. Orient the electrode plane to within 45 degrees of horizontal in horizontal installations. A deviation of more than 45 degrees of horizontal would place an electrode at or near the top of the sensor thereby making it more susceptible to insulation by air or entrapped gas at the top of the sensor.
The electrodes in the Rosemount 8711 are properly oriented when the top of the sensor is either vertical or horizontal, as shown in Figure 7-6. Avoid any mounting orientation that positions the top of the sensor at 45 degrees from the vertical or horizontal position.

Figure 7-6. Rosemount 8711 Mounting Position

**Flow Direction**

The sensor should be mounted so that the FORWARD end of the flow arrow, shown on the sensor identification tag, points in the direction of flow through the sensor (see Figure 7-7).

Figure 7-7. Flow Direction
INSTALLATION
(FLANGED SENSOR)

The following section should be used as a guide in the installation of the flange-type Rosemount 8750WA Sensors. Refer to page 7-8 for installation of the wafer-type Rosemount 8750WA Sensor.

Gaskets

⚠️ The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions. **Metallic or spiral-wound gaskets can damage the liner.** If the gaskets will be removed frequently, protect the liner ends. All other applications (including sensors with lining protectors or a grounding electrode) require only one gasket on each end connection, as shown in Figure 7-8. If grounding rings are used, gaskets are required on each side of the grounding ring, as shown in Figure 7-9.

**Figure 7-8. Gasket Placement**

![Figure 7-8. Gasket Placement](image1)

**Figure 7-9. Gasket Placement with Non-attached Grounding Rings**

![Figure 7-9. Gasket Placement with Non-attached Grounding Rings](image2)

Flange Bolts

Suggested torque values by sensor line size and liner type are listed in Table 7-1 on page 7-7. Tighten flange bolts in the incremental sequence as shown in Figure 7-10. See Table 7-1 for bolt sizes and hole diameters.

⚠️ See "Safety Messages" on pages 7-1 and 7-2 for complete warning information.
NOTE
Do not bolt one side at a time. Tighten each side simultaneously. Example:
1. Snug left
2. Snug right
3. Tighten left
4. Tighten right
Do not snug and tighten the upstream side and then snug and tighten the downstream side. Failure to alternate between the upstream and downstream flanges when tightening bolts may result in liner damage.

⚠ Always check for leaks at the flanges after tightening the flange bolts. Failure to use the correct flange bolt tightening methods can result in severe damage. All sensors require a second torquing 24 hours after initial flange bolt tightening.

⚠ See "Safety Messages" on pages 7-1 and 7-2 for complete warning information.
The following section should be used as a guide in the installation of the Rosemount 8750WA wafer style sensor. Refer to page 7-6 for installation of the flange-type Rosemount 8750WA sensor.

**Gaskets**

⚠️ The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions. **Metallic or spiral-wound gaskets can damage the liner.** If the gaskets will be removed frequently, protect the liner ends. If grounding rings are used, a gasket is required on each side of the grounding ring.

**Alignment and Bolting**

1. On 1½ - through 8-inch (40 through 200 mm) line sizes, place centering rings over each end of the sensor. The smaller line sizes, 0.15- through 1-inch (4 through 25 mm), do not require centering rings.

2. Insert studs for the bottom side of the sensor between the pipe flanges. Stud specifications are listed in Table 7-2. **Using carbon steel bolts on smaller line sizes, 0.15- through 1-inch (4 through 25 mm), rather than the required stainless steel bolts, will degrade performance.**
3. Place the sensor between the flanges. Make sure that the centering rings are properly placed in the studs. The studs should be aligned with the markings on the rings that correspond to the flange you are using.

4. Insert the remaining studs, washers, and nuts.

5. Tighten to the torque specifications shown in Table 7-3. Do not overtighten the bolts or the liner may be damaged.

**NOTE**
On the 4- and 6- inch PN 10-16, insert the sensor with rings first and then insert the studs. The slots on this ring scenario are located on the inside of the ring.

---

**Flange Bolts**

Sensor sizes and torque values for both Class 150 and Class 300 flanges are listed in Table 7-3. Tighten flange bolts in the incremental sequence, shown in Figure 7-10.

**NOTE**
Do not bolt one side at a time. Tighten each side simultaneously. Example:
1. Snug left
2. Snug right
3. Tighten left
4. Tighten right

Do not snug and tighten the upstream side and then snug and tighten the downstream side. Failure to alternate between the upstream and downstream flanges when tightening bolts may result in liner damage.
Always check for leaks at the flanges after tightening the flange bolts. All sensors require a second torquing 24 hours after initial flange bolt tightening.

Process grounding the sensor is one the most important details of sensor installation. Proper process grounding ensures that the transmitter amplifier is referenced to the process. This creates the lowest noise environment for the transmitter to make a stable reading. Use Table 7-4 to determine which grounding option to follow for proper installation.

**NOTE**
Consult factory for installations requiring cathodic protection or situations where there are high currents or high potential in the process.

The sensor case should always be earth grounded in accordance with national and local electrical codes. Failure to do so may impair the protection provided by the equipment. The most effective grounding method is direct connection from the sensor to earth ground with minimal impedance.

The Internal Ground Connection (Protective Ground Connection) located inside the junction box is the Internal Ground Connection screw. This screw is identified by the ground symbol: ⬌

Safety Information ........................................ page 8-1
Installation Check and Guide .......................... page 8-3
Diagnostic Messages ...................................... page 8-4
Transmitter Troubleshooting ......................... page 8-7
Quick Troubleshooting ................................. page 8-9

This section covers basic transmitter and sensor troubleshooting. Problems in the magnetic flowmeter system are usually indicated by incorrect output readings from the system, error messages, or failed tests. Consider all sources when identifying a problem in your system. If the problem persists, consult your local Emerson Process Management representative to determine if the material should be returned to the factory. Emerson Process Management offers several diagnostics that aid in the troubleshooting process.

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please read the following safety messages before performing any operation described in this section. Refer to these warnings when appropriate throughout this section.

SAFETY INFORMATION

⚠️ WARNING ⚠️

Failure to follow these installation guidelines could result in death or serious injury:

Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified. Verify that the operating environment of the sensor and transmitter is consistent with the appropriate FM or CSA approval.

Do not connect a Rosemount 8750WA12 to a non-Rosemount sensor that is located in an explosive atmosphere.

Mishandling products exposed to a hazardous substance may result in death or serious injury. If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

The 8750WA performs self diagnostics on the entire magnetic flowmeter system: the transmitter, the sensor, and the interconnecting wiring. By sequentially troubleshooting each individual piece of the magmeter system, it becomes easier to pin point the problem and make the appropriate adjustments.
If there are problems with a new magmeter installation, see “Installation Check and Guide” on page 8-3 for a quick guide to solve the most common installation problems. For existing magmeter installations, Table 8-5 lists the most common magmeter problems and corrective actions.
INSTALLATION CHECK AND GUIDE

Use this guide to check new installations of Rosemount magnetic flowmeter systems that appear to malfunction.

Before You Begin

Transmitter
Apply power to your system before making the following transmitter checks.

1. Verify that the correct sensor calibration number is entered in the transmitter. The calibration number is listed on the sensor nameplate.
2. Verify that the correct sensor line size is entered in the transmitter. The line size value is listed on the sensor nameplate.
3. Verify that the analog range of the transmitter matches the analog range in the control system.
4. Verify that the forced analog output and forced pulse output of the transmitter produces the correct output at the control system.

Sensor
Be sure that power to your system is removed before beginning sensor checks.

1. For horizontal flow installations, ensure that the electrodes remain covered by process fluid.

For vertical or inclined installations, ensure that the process fluid is flowing up into the sensor to keep the electrodes covered by process fluid.

2. Ensure that the grounding straps on the sensor are connected to grounding rings, lining protectors, or the adjacent pipe flanges. Improper grounding will cause erratic operation of the system.

Wiring

1. The signal wire and coil drive wire must be twisted shielded cable. Emerson Process Management, Rosemount division, recommends 20 AWG twisted shielded cable for the electrodes and 14 AWG twisted shielded cable for the coils.

2. The cable shield must be connected at both ends of the electrode and coil drive cables. Connection of the signal wire shield at both ends is necessary for proper operation. It is recommended that the coil drive wire shield also be connected at both ends for maximum flowmeter performance.

3. The signal and coil drive wires must be separate cables, unless Emerson Process Management specified combo cable is used. See Table 2-3 on page 2-17.

4. The single conduit that houses both the signal and coil drive cables should not contain any other wires.

Process Fluid

1. The process fluid conductivity should be 5 microsiemens (5 micro mhos) per centimeter minimum.

2. The process fluid must be free of air and gasses.

3. The sensor should be full of process fluid.
### DIAGNOSTIC MESSAGES

Problems in the magnetic flowmeter system are usually indicated by incorrect output readings from the system, error messages, or failed tests. Consider all sources in identifying a problem in your system.

</tbody>
</table>
QUICK TROUBLESHOOTING

Step 1: Wiring Errors
The most common magmeter problem is wiring between the sensor and the transmitter in remote mount installations. The signal wire and coil drive wire must be twisted shielded cable: 20 AWG twisted shielded cable for the electrodes and 14 AWG twisted shielded cable for the coils. Ensure that the cable shield is connected at both ends of the electrode and coil drive cables. Signal and coil drive wires must have their own cables. The single conduit that houses both the signal and coil drive cables should not contain any other wires. For more information on proper wiring practices, refer to “Transmitter to Flowtube Sensor Wiring” on page 2-17.

Step 2: Process Noise
In some circumstances, process conditions rather than the magmeter can cause the meter output to be unstable. Possible solutions for addressing a noisy process situation are given below. When the output attains the desired stability, no further steps are required.

Use the Auto Zero function to initialize the transmitter for use with the 37.5 Hz coil drive mode only. Run this function only with the transmitter and sensor installed in the process. The sensor must be filled with process fluid with zero flow rate. Before running the auto zero function, be sure the coil drive mode is set to 37 Hz.

Set the loop to manual if necessary and begin the auto zero procedure. The transmitter completes the procedure automatically in about 90 seconds. A symbol appears in the lower right-hand corner of the display to indicate that the procedure is running.

1. Change the coil drive to 37 Hz. Complete the Auto Zero function, if possible (see “Coil Drive Frequency” on page 4-16).
2. Turn on Digital Signal Processing (see “Signal Processing” on page 4-31)
3. Increase the damping (see “PV Damping” on page 3-12).

If the preceding steps fail to resolve the process noise symptoms, consult your Emerson Process Management sales representative about using a high-signal magnetic flowmeter system.

Step 3: Installed Sensor Tests
If a problem with an installed sensor is identified, Table 8-6 can assist in troubleshooting the sensor. Before performing any of the sensor tests, disconnect or turn off power to the transmitter. To interpret the results, the hazardous location certification for the sensor must be known. Applicable codes for the Rosemount 8750WA are N0, N5, and NH. Applicable codes for the Rosemount 8707 are N0 and N5. Always check the operation of test equipment before each test.

If possible, take all readings from inside the sensor junction box. If the sensor junction box is inaccessible, take measurements as close as possible. Readings taken at the terminals of remote-mount transmitters that are more than 100 feet away from the sensor may provide incorrect or inconclusive information and should be avoided. A sensor circuit diagram is provided in Figure 8-1 on page 8-11.

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Low conductivity</td>
<td>• Leaky electrode</td>
</tr>
</tbody>
</table>

To test the sensor, a multimeter capable of measuring conductance in nanosiemens is preferred. Nanosiemens is the reciprocal of resistance.

$$1 \text{ nanosiemens} = \frac{1}{1 \text{ gigaohm}}$$

or

$$1 \text{ nanosiemens} = \frac{1}{1 \times 10^9 \text{ ohm}}$$
Step 4: Uninstalled Sensor Tests

An uninstalled sensor can also be used for sensor troubleshooting. To interpret the results, the hazardous location certification for the sensor must be known. Applicable codes for the Rosemount 8750WA are N0, N5, and NH.

A sensor circuit diagram is provided in Figure 8-1. Take measurements from the terminal block and on the electrode head inside the sensor. The measurement electrodes, 18 and 19, are on opposite sides in the inside diameter. If applicable, the third grounding electrode is in between the other two electrodes. On Rosemount 8750WA wafer sensors, electrode 18 is near the sensor junction box and electrode 19 is near the bottom of the sensor (Figure 8-2). The different sensor styles will have slightly different resistance readings. Flanged sensor resistance readings are in Table 8-7 while wafer sensor resistance readings are in Table 8-8.

See "Safety Information" on page 8-1 for complete warning information.
To insure accuracy of resistance readings, zero out multimeter by shorting and touching the leads together.

Table 8-7. Uninstalled Rosemount 8750WA Flanged Sensor Tests

<table>
<thead>
<tr>

(1) It is difficult to tell from visual inspection alone which electrode is wired to which number terminal in the terminal block. Measure both electrodes. One electrode should result in an open reading, while the other electrode should be less than 275Ω.

ROSEMOUNT 8750WA SPECIFICATIONS

Functional Specifications

<table>
<thead>
<tr>
<th>Service</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water and water-based fluids</td>
</tr>
</tbody>
</table>

**Line Sizes**

\[ \frac{1}{2} - 36 \text{ in. (13 - 914 mm)} \]

**Sensor Compensation**

Rosemount sensors are flow-calibrated and assigned a calibration factor at the factory. The calibration factor is entered into the transmitter, enabling interchangeability of sensors without calculations or a compromise in accuracy.

**Conductivity Limits**

Process liquid must have a conductivity of 5 microsiemens/cm (5 micromhos/cm) or greater. Excludes the effect of interconnecting cable length in remote mount transmitter installations.

**Pressure Limits**

Per ASME B16.5 and ASME B16.47 for the flange selected.

**Sensor Coil Resistance**

350 Ω maximum

**Flow Rate Range**

Capable of processing signals from fluids that are traveling between 0.04 and 30 ft/s (0.01 to 10 m/s) for both forward and reverse flow in all sensor sizes. Full scale continuously adjustable between –30 and 30 ft/s (–10 to 10 m/s).

**Sensor Ambient Temperature Limits**

–20 to 140 °F (–30 to 60 °C)

**Process Temperature Limits**

- **Polyurethane Lining**
  0 to 140 °F (–18 to 60 °C)

- **Neoprene Lining**
  0 to 185 °F (–18 to 85 °C)

- **PTFE Lining**
  -20 to 248 °F (–29 to 120 °C)
Optional Digital Output Function(1)

Externally powered at 5 to 24 V dc, transistor switch closure up to 3 W to indicate either:

**Reverse Flow:**
Activates switch closure output when reverse flow is detected. The reverse flow rate is displayed.

**Zero Flow:**
Activates switch closure output when flow goes to 0 ft/s.

**Empty Pipe:**
Activates switch closure output when empty pipe is detected.

**Transmitter Fault:**
Activates switch closure output when a transmitter fault is detected.

Optional Digital Input Function(1)

Externally powered at 5 to 24 V dc, transistor switch closure up to 3 W to indicate either:

**Net Total Reset:**
Resets the net totalizer value to zero.

**Positive Zero Return (PZR):**
Simulates zero-flow condition.

Submergence Protection (Sensor) - SA/SB/SC Options

IP68. Continuous submergence to 30 ft. (10 m). Requires conduit entries of the sensor remote junction box be properly sealed to prevent water ingress. This requires the user to install sealed IP68 approved cable glands, conduit connections, or conduit plugs.

Option Codes SA, SB, SC, SD, SE, and SF provide a pre-wired potted and sealed junction box to prevent the ingress of water. These options still require the use of sealed conduits to meet IP68 protection requirements.

Example of a protection category:

Identity letters - IP
First identity number - 6(2)
Second identity number - 8(3)

---

(1) Available with 8750WA32 only
(2) Protection against the entry of dust (dust-proof). Complete contact prevention.
(3) The enclosure is suitable for constant submersion in water under given conditions which are determined by the manufacturer (submersion).
PERFORMANCE SPECIFICATIONS

(System specifications are given using the frequency output and with the unit at referenced conditions).

8750WA32 and 8750WA12

Flanged Sensor Accuracy
The standard System Accuracy is 0.5% of rate from 1 to 30 ft/s (0.3 to 10 m/s). Includes combined effects of linearity, hysteresis, repeatability and calibration uncertainty. Accuracy is 0.005 ft/s (0.0015 m/s) from low flow cutoff to 1.0 ft/s (0.3 m/s).

The (D1) optional high system accuracy is 0.25% of rate from 3 to 30 ft/s (1 to 10 m/s).

Wafer Sensor Accuracy
System accuracy is ±0.5% of rate from 3 to 30 ft/s (1 to 10 m/s); between 0.04 and 3.0 ft/s (0.01 and 0.3 m/s), the system has an accuracy of ±0.015 ft/s (0.005 m/s). Optional high accuracy is ±0.25% of rate from 3 to 30 ft/s (1 to 10 m/s).

Repeatability
±0.1% of reading

Response Time
0.2 seconds maximum response to step change in input

Stability
±0.25% of rate over six months

Ambient Temperature Effect
±1% per 100 °F (37.8 °C)

Mounting Position Effect
None when installed to ensure sensor remains full.

Studs, Nuts, and Washers(1)
ASME B16.5 (ANSI)

0.5- and 1-in. (15 and 25 mm):
316 SST, ASTM A193, Grade B8M, Class 1 threaded mounting studs;
ASTM A194, Grade 8M heavy hex nuts;
SAE per ANSI B18.2.1, Type A, Series N flat washers.

1.5- through 8-in. (40 through 200 mm):
Carbon Steel, ASTM A193, Grade B7, Class 1 threaded mounting studs;
ASTM A194, Grade 2H heavy hex nuts;
SAE per ANSI B18.2.1, Type A, Series N flat washers; all items clear,
chromate zinc-plated.

Electrical Connections
Two 1/2–14 NPT connections with number 8 screw terminals are provided in
the terminal enclosure for electrical wiring.

Grounding Electrode
A grounding electrode is installed similarly to the measurement electrodes
through the sensor lining on 8750WA sensors. It is available in all electrode
materials.

Grounding Rings
Grounding rings are installed between the flange and the sensor face on both
ends of the sensor. Single ground rings can be installed on either end of the
sensor. They have an I.D. slightly larger than the sensor I.D. and an external
tab to attach ground wiring. Grounding rings are available in 316L SST, and
Nickel Alloy 276 (UNS N10276).

Lining Protectors
Lining protectors are installed between the flange and the sensor face on both
ends of the sensor. The leading edge of lining material is protected by the
lining protector; lining protectors cannot be removed once they are installed.
Lining protectors are available in 316L SST, and Nickel Alloy 276 (UNS
N10276).

Transmitters

8750WA32

Materials of Construction

Housing
Low-copper aluminum
Nema 4X and IEC 60529 IP66

Paint
Polyurethane

Cover Gasket
Rubber
Electrical Connections
Two or three ½–14 NPT with number 8 screw terminal connections are provided for electrical wiring. PG13.5 and CM20 adapters are available. Screw terminals provided for all connections. Power wiring connected to transmitter only. Integrally mounted transmitters are factory wired to the sensor.

Mounting
Integrally mounted transmitters do not require interconnecting cables. The local display and transmitter can be rotated in 90° increments. Remote mounted transmitters require only a single conduit connection to the sensor.

Transmitter Weight
Approximately 7 pounds (3.2 kg). Add 0.5 pounds (0.5 kg) for local display.

Materials of Construction

8750WA12

Electrical Connections
Four ½–14 NPT connections provided on the base of the transmitter. Screw terminals provided for all of the connections. Power wiring connected to the transmitter only. Remote mounted transmitters require only a single conduit connection to the sensor.

NOTE
If ¾ - 14 NPT connections are required, ½ to ¾ in. adapter kits are available for order.

Line Power Fuses

90–250 V AC systems
2 amp, Quick-acting Bussman AGCI or equivalent

12–42 V DC systems
3 amp, Quick-acting Bussman AGCI or equivalent

Transmitter Weight
Transmitter approximately 9 lb (4 kg). Add 1 lb (0.5 kg) for local operator interface.

DIAGNOSTIC AVAILABILITY

Rosemount Magmeters provide device diagnostics that powers PlantWeb and informs the user of abnormal situations throughout the life of the meter - from installation to maintenance and meter verification. With Rosemount Magmeter diagnostics enabled, users can change their practices to improve plant availability and output, and reduce costs through simplified installation, maintenance and troubleshooting.

Options for Accessing Diagnostics

Rosemount magmeter diagnostics can be accessed through the Local Operator Interface (LOI), the 375 Handheld Communicator, and AMS Device Manager.

Access Diagnostics through the LOI for quicker installation, maintenance, and meter verification

Rosemount magmeter diagnostics are available through the LOI to make maintenance of every magmeter easier.
Access Diagnostics through AMS Intelligent Device Manager for the Ultimate Value

The value of the Diagnostics increases significantly when AMS is used. Now the user gets a simplified screen flow and procedures for how to respond to the Diagnostic messages.

LICENSING AND ENABLING

All non-basic diagnostics must be licensed by ordering option code DA1, DA2, or both. In the event that a diagnostic option is not ordered, advanced diagnostics can be licensed in the field through the use of a license key. To obtain a license key, contact your local Emerson Process Management representative. Each transmitter has a unique license key specific to the diagnostic option code. See the detailed procedures below for entering the license key and enabling the advanced diagnostics.

Licensing the 8750WA12 Diagnostics

For licensing the advanced diagnostics, follow the steps below.

1. Power-up the 8750WA transmitter
2. Verify that you have 5.3.1 software or later
   - HART Fast Keys 1, 4, 6, 10, 3
   - AMS Tab License
3. Determine the Device ID
   - HART Fast Keys 1, 4, 6, 6
   - AMS Tab License
4. Obtain a License Key from your local Emerson Process Management representative.
5. Enter License Key
   - HART Fast Keys 1, 2, 3, 5, 2, 2
   - AMS Tab License
6. Enable Advanced Diagnostics
   - HART Fast Keys 1, 2, 1
   - AMS Tab Diagnostics

TUNABLE EMPTY PIPE DETECTION

The Tunable Empty Pipe detection provides a means of minimizing issues and false readings when the pipe is empty. This is most important in batching applications where the pipe may run empty with some regularity.

If the pipe is empty, this diagnostic will activate, set the flow rate to 0, and deliver a PlantWeb alert.

Turning Empty Pipe On/Off

- HART Fast Keys 1, 2, 1, 1
- AMS Tab Diagnostics

The Empty Pipe diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 Option) was ordered, then the Empty Pipe diagnostic will be turned on. If DA1 was not ordered, the default setting is off.
Tunable Empty Pipe Parameters

The Tunable Empty Pipe diagnostic has one read-only parameter, and two parameters that can be custom configured to optimize the diagnostic performance.

**Empty Pipe Value**

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 4, 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS Tab</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

Reads the current Empty Pipe Value. This is a read-only value. This number is a unitless number and is calculated based on multiple installation and process variables such as sensor type, line size, process fluid properties, and wiring. If the Empty Pipe Value exceeds the Empty Pipe Trigger Level for a specified number of updates, then the Empty Pipe diagnostic alert will activate.

**Empty Pipe Trigger Level**

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 4, 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS Tab</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

Limits: 3 to 2000

This value configures the threshold limit that the Empty Pipe Value must exceed before the Empty Pipe diagnostic alert activates. The default setting from the factory is 100.

**Empty Pipe Counts**

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 4, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS Tab</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

Limits: 5 to 50

This value configures the number of consecutive updates that the Empty Pipe Value must exceed the Empty Pipe Trigger Level before the Empty Pipe diagnostic alert activates. The default setting from the factory is 5.

Optimizing Tunable Empty Pipe

The Tunable Empty Pipe diagnostic is set at the factory to properly diagnose most applications. If this diagnostic unexpectedly activates, the following procedure can be followed to optimize the Empty Pipe diagnostic for the application.

1. Record the Empty Pipe Value with a full pipe condition.

**Example**

Full reading = 0.2

2. Record the Empty Pipe Value with an empty pipe condition.

**Example**

Empty reading = 80.0

3. Set the Empty Pipe Trigger Level to a value between the full and empty readings. For increased sensitivity to empty pipe conditions, set the trigger level to a value closer to the full pipe value.

**Example**

Set the trigger level to 25.0

4. Set the Empty Pipe Counts to a value corresponding to the desired sensitivity level for the diagnostic. For applications with entrained air or potential air slugs, less sensitivity may be desired.

**Example**

Set the counts to 10
Troubleshooting Empty Pipe

The following actions can be taken if Empty Pipe detection is unexpected.

1. Verify the sensor is full.
2. Verify that the sensor has not been installed with a measurement electrode at the top of the pipe.
3. Decrease the sensitivity by setting the Empty Pipe Trigger Level to a value above the Empty Pipe Value read with a full pipe.
4. Decrease the sensitivity by increasing the Empty Pipe Counts to compensate for process noise. The Empty Pipe Counts is the number of consecutive Empty Pipe Value readings above the Empty Pipe Trigger Level required to activate the Empty Pipe diagnostic. The count range is 5-50, with factory default set at 5.
5. Increase process fluid conductivity above 50 microsiemens/cm.
6. Properly connect the wiring between the sensor and the transmitter. Corresponding terminal block numbers in the sensor and transmitter must be connected.
7. Perform the sensor electrical resistance tests. Confirm the resistance reading between coil ground (ground symbol) and coil (1 and 2) is infinity, or open. Confirm the resistance reading between electrode ground (17) and an electrode (18 or 19) is greater than 2 kohms and rises. For more detailed information, consult Table 6-6 on page 6-9.

GROUND/WIRING FAULT DETECTION

The Ground/Wiring Fault Detection diagnostic provides a means of verifying installations are done correctly. If the installation is not wired or grounded properly, this diagnostic will activate and deliver a PlantWeb alert. This diagnostic can also detect if the grounding is lost over-time due to corrosion or another root cause.

Turning Ground/Wiring Fault On/Off

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 1, 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS Tab</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

The Ground/Wiring Fault diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 Option) was ordered, then the Ground/Wiring Fault diagnostic will be turned on. If DA1 was not ordered or licensed, this diagnostic is not available.

Ground/Wiring Fault Parameters

The Ground/Wiring Fault diagnostic has one read-only parameter. It does not have any configurable parameters.

<table>
<thead>
<tr>
<th>Line Noise</th>
</tr>
</thead>
<tbody>
<tr>
<td>HART Fast Keys</td>
</tr>
<tr>
<td>AMS Tab</td>
</tr>
</tbody>
</table>

Reads the current amplitude of the Line Noise. This is a read-only value. This number is a measure of the signal strength at 50/60 Hz. If the Line Noise value exceeds 5 mV, then the Ground/Wiring Fault diagnostic alert will activate.
**Troubleshooting**  

**Ground/Wiring Fault**  

The transmitter detected high levels of 50/60 Hz noise caused by improper wiring or poor process grounding.

1. Verify that the transmitter is earth grounded.
2. Connect ground rings, grounding electrode, lining protector, or grounding straps. Grounding diagrams can be found in “Grounding” on page 5-12.
3. Verify sensor is full.
4. Verify wiring between sensor and transmitter is prepared properly. Shielding should be stripped back less than 1 in. (25 mm).
5. Use separate shielded twisted pairs for wiring between sensor and transmitter.
6. Properly connect the wiring between the sensor and the transmitter. Corresponding terminal block numbers in the sensor and transmitter must be connected.

**Ground/Wiring Fault Functionality**  

The transmitter continuously monitors signal amplitudes over a wide range of frequencies. For the Ground/Wiring Fault diagnostic, the transmitter specifically looks at the signal amplitude at frequencies of 50 Hz and 60 Hz which are the common AC cycle frequencies found throughout the world. If the amplitude of the signal at either of these frequencies exceeds 5 mV, that is an indication that there is a ground or wiring issue and that stray electrical signals are getting into the transmitter. The diagnostic alert will activate indicating that the ground and wiring of the installation should be carefully reviewed.

**HIGH PROCESS NOISE DETECTION**  

The High Process Noise diagnostic detects if there is a process condition causing unstable or noisy readings, but the noise is not real flow variation. One common cause of high process noise is slurry flow, like pulp stock or mining slurries. Other conditions that cause this diagnostic to activate are high levels of chemical reaction or entrained gas in the liquid. If unusual noise or variation is seen, this diagnostic will activate and deliver a PlantWeb alert. If this situation exists and is left without remedy, it will add additional uncertainty and noise to the flow reading.

**Turning High Process Noise On/Off**

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 1, 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOI Key</td>
<td>AUX. FUNCTION</td>
</tr>
<tr>
<td>AMS Tab</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

The High Process Noise diagnostic can be turned on or off as required by the application. If the advanced diagnostics suite 1 (DA1 Option) was ordered, then the High Process Noise diagnostic will be turned on. If DA1 was not ordered or licensed, this diagnostic is not available.
The High Process Noise diagnostic has two read-only parameters. It does not have any configurable parameters. This diagnostic requires that flow be present in the pipe and the velocity be > 1 ft/s.

### 5 Hz Signal to Noise Ratio

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>AMS Tab</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2, 4, 4</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

Reads the current value of the signal to noise ratio at the coil drive frequency of 5 Hz. This is a read-only value. This number is a measure of the signal strength at 5 Hz relative to the amount of process noise. If the transmitter is operating in 5 Hz mode, and the signal to noise ratio remains below 25 for one minute, then the High Process Noise diagnostic alert will activate.

### 37 Hz Signal to Noise Ratio

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>AMS Tab</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2, 4, 5</td>
<td>Diagnostics</td>
</tr>
</tbody>
</table>

Reads the current value of the signal to noise ratio at the coil drive frequency of 37 Hz. This is a read-only value. This number is a measure of the signal strength at 37 Hz relative to the amount of process noise. If the transmitter is operating in 37 Hz mode, and the signal to noise ratio remains below 25 for one minute, then the High Process Noise diagnostic alert will activate.

### Troubleshooting High Process Noise

The transmitter detected high levels of process noise. If the signal to noise ratio is less than 25 while operating in 5 Hz mode, proceed with the following steps:

1. Increase transmitter coil drive frequency to 37 Hz (refer to “Coil Drive Frequency” on page 4-16) and, if possible, perform Auto Zero function (refer to “Auto Zero” on page 4-15).
2. Verify sensor is electrically connected to the process with grounding electrode, grounding rings with grounding straps, or lining protector with grounding straps.
3. If possible, redirect chemical additions downstream of the magmeter.
4. Verify process fluid conductivity is above 10 microsiemens/cm.

If the signal to noise ratio is less than 25 while operating in 37 Hz mode, proceed with the following steps:

1. Turn on the Digital Signal Processing (DSP) technology and follow the setup procedure (refer to Appendix D: Digital Signal Processing). This will minimize the level of damping in the flow measurement and control loop while also stabilizing the reading to minimize valve actuation.
2. Increase damping to stabilize the signal (refer to “PV Damping” on page 3-12). This will add dead-time to the control loop.
3. Move to a Rosemount High-Signal flowmeter system. This flowmeter will deliver a stable signal by increasing the amplitude of the flow signal by ten times to increase the signal to noise ratio. For example if the signal to noise ratio (SNR) of a standard magmeter is 5, the High-Signal would have a SNR of 50 in the same application. The Rosemount High-Signal system is comprised of the 8707 sensor which has modified coils and magnetics and the 8750WA12H High-Signal transmitter.
NOTE
In applications where very high levels of noise are a concern, it is recommended that a dual-calibrated Rosemount High-Signal 8707 sensor be used. These sensors can be calibrated to run at lower coil drive current supplied by the standard Rosemount transmitters, but can also be upgraded by changing to the 8750WA12H High-Signal transmitter.

High Process Noise Functionality

The High Process Noise diagnostic is useful for detecting situations where the process fluid may be causing electrical noise resulting in a poor measurement from the magnetic flowmeter. There are three basic types of process noise that can affect the performance of the magnetic flowmeter system.

1/f Noise
This type of noise has higher amplitudes at lower frequencies, but generally degrades over increasing frequencies. Potential sources of 1/f noise include chemical mixing and the general background noise of the plant.

Spike Noise
This type of noise generally results in a high amplitude signal at specific frequencies which can vary depending on the source of the noise. Common sources of spike noise include chemical injections directly upstream of the flowmeter, hydraulic pumps, and slurry flows with low concentrations of particles in the stream. The particles bounce off of the electrode generating a “spike” in the electrode signal. An example of this type of flow stream would be a recycle flow in a paper mill.

White Noise
This type of noise results in a high amplitude signal that is relatively constant over the frequency range. Common sources of white noise include chemical reactions or mixing that occurs as the fluid passes through the flowmeter and high concentration slurry flows where the particulates are constantly passing over the electrode head. An example of this type of flow stream would be a basis weight stream in a paper mill.

The transmitter continuously monitors signal amplitudes over a wide range of frequencies. For the high process noise diagnostic, the transmitter specifically looks at the signal amplitude at frequencies of 2.5 Hz, 7.5 Hz, 32.5 Hz, and 42.5 Hz. The transmitter uses the values from 2.5 and 7.5 Hz and calculates an average noise level. This average is compared to the amplitude of the signal at 5 Hz. If the signal amplitude is not 25 times greater than the noise level, and the coil drive frequency is set at 5 Hz, the High Process Noise diagnostic will activate indicating that the flow signal may be compromised. The transmitter performs the same analysis around the 37.5 Hz coil drive frequency using the 32.5 Hz and 42.5 Hz values to establish a noise level.

8714i Meter Verification

The 8714i Meter Verification diagnostic provides a means of verifying the flowmeter is within calibration without removing the sensor from the process. This is a manually initiated diagnostic test that provides a review of the transmitter and sensors critical parameters as a means to document verification of calibration. The results of running this diagnostic provide the deviation amount from expected values and a pass/fail summary against user-defined criteria for the application and conditions.
Initiating 8714i Meter Verification

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>Context Menu, Diagnostics and Tests, 8714i Meter Verification</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2, 3, 3, 1</td>
<td>AMS Tab</td>
</tr>
</tbody>
</table>

The 8714i Meter Verification diagnostic can be initiated as required by the application. If the advanced diagnostic suite (DA2) was ordered, then the 8714i Meter Verification diagnostic will be available. If DA2 was not ordered or licensed, this diagnostic will not be available.

Sensor Signature Parameters

The sensor signature describes the magnetic behavior of the sensor. Based on Faraday's law, the induced voltage measured on the electrodes is proportional to the magnetic field strength. Thus, any changes in the magnetic field will result in a calibration shift of the sensor.

Establishing the baseline sensor signature

The first step in running the 8714i Meter Verification test is establishing the reference signature that the test will use as the baseline for comparison. This is accomplished by having the transmitter take a signature of the sensor.

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>Context Menu, Diagnostics and Tests,</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2, 3, 3, 3, 2</td>
<td>AMS Tab</td>
</tr>
</tbody>
</table>

Having the transmitter take an initial sensor signature when first installed will provide the baseline for the verification tests that are done in the future. The sensor signature should be taken during the start-up process when the transmitter is first connected to the sensor, with a full line, and ideally with no flow in the line. Running the sensor signature procedure when there is flow in the line is permissible, but this may introduce some noise into the signature measurements. If an empty pipe condition exists, then the sensor signature should only be run for the coils.

Once the sensor signature process is complete, the measurements taken during this procedure are stored in non-volatile memory to prevent loss in the event of a power interruption to the meter.

8714i Meter Verification Test Parameters

The 8714i has a multitude of parameters that set the test criteria, test conditions, and scope of the calibration verification test.

Test Conditions for the 8714i Meter Verification

There are three possible test conditions that the 8714i Meter Verification test can be initiated under. This parameter is set at the time that the Sensor Signature or 8714i Meter Verification test is initiated.

**Full, No Flow**
Run the 8714i Meter Verification test with a full pipe and no flow in the line. Running the 8714i Meter Verification test under this condition provides the most accurate results and the best indication of magnetic flowmeter health.

**Flowing, Full**
Run the 8714i Meter Verification test with a full pipe and flow in the line. Running the 8714i Meter Verification test under this condition provides the ability to verify the magnetic flowmeter health without shutting down the process flow in applications where a shutdown is not possible. Running the meter verification under flowing conditions can cause false fails if the flow rate is not at a steady flow, or if there is process noise present.
Empty Pipe
Run the 8714i Meter Verification test with an empty pipe. Running the 8714i Meter Verification test under this condition provides the ability to verify the magnetic flowmeter health with an empty pipe. Running the calibration verification under empty pipe conditions will not check the electrode circuit health.

8714i Meter Verification Test Criteria
The 8714i Meter Verification diagnostic provides the ability for the user to define the test criteria that the verification must test to. The test criteria can be set for each of the flow conditions discussed above.

<table>

8714i Meter Verification Test Scope
The 8714i Meter Verification can be used to verify the entire flowmeter installation, or individual parts such as the transmitter or sensor. This parameter is set at the time that the 8714i Meter Verification test is initiated.

All
Run the 8714i Meter Verification test and verify the entire flowmeter installation. This parameter results in the meter verification performing the transmitter calibration verification, sensor calibration verification, coil health check, and electrode health check. Transmitter calibration and sensor calibration are verified to the percentage associated with the test condition selected when the test was initiated.

<table>

</thead>
<tbody>
<tr>
<td>AMS</td>
<td>Context Menu, Diagnostics and Tests, 8714i Meter Verification</td>
</tr>
</tbody>
</table>
Transmitter
Run the 8714i Meter Verification test on the transmitter only. This results in the verification test only checking the transmitter calibration to the limits of the test criteria selected when the 8714i Meter Verification test was initiated.

<table>
<thead>
<tr>
<th>HART Fast Keys</th>

</tbody>
</table>

Sensor
Run the 8714i Meter Verification test on the sensor only. This results in the verification test checking the sensor calibration to the limits of the test criteria selected when the 8714i Meter Verification test was initiated, verifying the coil circuit health, and the electrode circuit health.

8714i Meter Verification

Test Results Parameters
Once the 8714i Meter Verification test is initiated, the transmitter will make several measurements to verify the transmitter calibration, sensor calibration, coil circuit health, and electrode circuit health. The results of these tests can be reviewed and recorded on the calibration verification report found on page C-15. This report can be used to show that the meter is within the required calibration limits to comply with governmental regulatory agencies such as the Environmental Protection Agency or Food and Drug Administration.

Viewing the 8714i Meter Verification Results
Depending on the method used to view the results, they will be displayed in either a menu structure, as a method, or in the report format. When using the HART Field Communicator, each individual component can be viewed as a menu item. When using the LOI, the parameters are viewed as a method using the enter key to cycle through the results. In AMS the calibration report is populated with the necessary data eliminating the need to manually complete the report found on page C-15.

NOTE
When using AMS there are two possible methods that can be used to print the report. Method one involves taking a screen capture of the 8714i Report tab. Using Ctrl + Alt + PrntScrn will capture the active window and allow for pasting of the report directly into a word processing program.

Method two involves using the print feature within AMS while on the status screen. This will result in a printout of all of the information stored on the status tabs. Page two of the report will contain all of the necessary calibration verification result data.

The results are displayed in the following order:

Test Condition
Review the test condition that the 8714i Meter Verification test was performed under.

<table>

### Optimizing the 8714i Meter Verification
The 8714i Meter Verification diagnostic can be optimized by setting the test criteria to the desired levels necessary to meet the compliance requirements of the application. The following examples below will provide some guidance on how to set these levels.

#### Example
An effluent meter must be certified every year to comply with Environmental Protection Agency and Pollution Control Agency standards. These governmental agencies require that the meter be certified to five percent accuracy.

Since this is an effluent meter, shutting down the process may not be possible. In this instance the 8714i Meter Verification test will be performed under flowing conditions. Set the test criteria for Flowing, Full to five percent to meet the requirements of the governmental agencies.

#### Example
A pharmaceutical company requires bi-annual verification of meter calibration on a critical feed line for one of their products. This is an internal standard, but plant requirements require a calibration record be kept on-hand. Meter calibration on this process must meet one percent. The process is a batch process so it is possible to perform the calibration verification with the line full and with no flow.

Since the 8714i Meter Verification test can be run under no flow conditions, set the test criteria for No Flow to one percent to comply with the necessary plant standards.

#### Example
A food and beverage company requires an annual calibration of a meter on a product line. The plant standard calls for the accuracy to be three percent or better. They manufacture this product in batches, and the measurement cannot be interrupted when a batch is in process. When the batch is complete, the line goes empty.

Since there is no means of performing the 8714i Meter Verification test while there is product in the line, the test must be performed under empty pipe conditions. The test criteria for Empty Pipe should be set to three percent, and it should be noted that the electrode circuit health cannot be verified.
Troubleshooting the 8714i Meter Verification Test

In the event that the 8714i Meter Verification test fails, the following steps can be used to determine the appropriate course of action. Begin by reviewing the 8714i results to determine the specific test that failed.

<table>
<thead>
<tr>
<th>Test</th>
<th>Potential Causes of Failure</th>
<th>Steps to Correct</th>
</tr>
</thead>
</table>
| Transmitter Calibration Verification Test Failed | • Unstable flow rate during the verification test  
• Noise in the process  
• Transmitter drift  
• Faulty electronics | • Perform the test with no flow in the pipe  
• Check calibration with an external standard like the 8714D  
• Perform a digital trim  
• Replace the electronics |
| Sensor Calibration Verification Failed | • Moisture in the terminal block of the sensor  
• Calibration shift caused by heat cycling or vibration | • Clean and dry the terminal block  
• Remove the sensor and send back for recalibration. |
| Coil Circuit Health Failed | • Moisture in the terminal block of the sensor  
• Shorted Coil | • Clean and dry the terminal block  
• Perform the sensor checks detailed on page C-15. |
| Electrode Circuit Health Failed | • Moisture in the terminal block of the sensor  
• Coated Electrodes  
• Shorted Electrodes | • Clean and dry the terminal block  
• Perform the sensor checks detailed on page C-15. |

8714i Meter Verification Functionality

The 8714i Meter Verification diagnostic functions by taking a baseline sensor signature and then comparing measurements taken during the verification test to these baseline results.

Sensor Signature Values

The sensor signature describes the magnetic behavior of the sensor. Based on Faraday’s law, the induced voltage measured on the electrodes is proportional to the magnetic field strength. Any changes in the magnetic field will result in a calibration shift of the sensor. Having the transmitter take an initial sensor signature when first installed will provide the baseline for the verification tests that are done in the future. There are three specific measurements that are stored in the transmitter’s non-volatile memory that are used when performing the meter verification.

Coil Circuit Resistance

The Coil Circuit Resistance is a measurement of the coil circuit health. This value is used as a baseline to determine if the coil circuit is still operating correctly when the 8714i Meter Verification diagnostic is initiated.

| HART Fast Keys | 1,2,3,3,3,1,1 |
| AMS Tab | Config/Setup, 8714i |

Coil Signature

The Coil Signature is a measurement of the magnetic field strength. This value is used as a baseline to determine if a sensor calibration shift has occurred when the 8714i Meter Verification diagnostic is initiated.

| HART Fast Keys | 1,2,3,3,3,1,2 |
| AMS Tab | Config/Setup, 8714i |
Electrode Circuit Resistance

The Electrode Circuit Resistance is a measurement of the electrode circuit health. This value is used as a baseline to determine if the electrode circuit is still operating correctly when the 8714i Meter Verification diagnostic is initiated.

8714i Meter Verification Measurements

The 8714i Meter Verification test will make measurements of the coil resistance, coil signature, and electrode resistance and compare these values to the values taken during the sensor signature process to determine the sensor calibration deviation, the coil circuit health, and the electrode circuit health. In addition, the measurements taken by this test can provide additional information when troubleshooting the meter.

Coil Circuit Resistance

The Coil Circuit Resistance is a measurement of the coil circuit health. This value is compared to the coil circuit resistance baseline measurement taken during the sensor signature process to determine coil circuit health.

## 4-20 MA LOOP VERIFICATION (8750WA32 ONLY)

The 4-20 mA Loop Verification diagnostic provides a means of verifying the analog output loop is functioning properly. This is a manually initiated diagnostic test. This diagnostic checks the integrity of the analog loop and provides a health status of the circuit. If the verification does not pass, this will be highlighted in the results given at the end of the check.

### Initiating 4-20 mA Loop Verification

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 3, 4, 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS</td>
<td>Context Menu, Diagnostics and Tests, Analog Output Verification</td>
</tr>
</tbody>
</table>

The 4-20 mA Loop Verification diagnostic can be initiated as required by the application. If the advanced diagnostics suite 2 (DA2 Option) was ordered, then the 4-20 mA Loop Verification diagnostic will be available. If DA2 was not ordered or licensed, this diagnostic is not available.
4-20 mA Loop Verification Parameters

The 4-20 mA Loop Verification diagnostic has one read-only parameter. It does not have any configurable parameters.

4-20 mA Loop Verification Test Result

<table>
<thead>
<tr>
<th>HART Fast Keys</th>
<th>1, 2, 3, 4, 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMS</td>
<td></td>
</tr>
</tbody>
</table>

Shows the results of the 4-20 mA Loop Verification test as either passed or failed.

Troubleshooting 4-20 mA Loop Verification

The following steps should be followed to identify the cause of the diagnostic failure.

- Check analog loop wiring
- Perform a manual loop test
- Check internal/external power
- Perform D/A Trim
- Check loop resistance
- Replace electronics

4-20 mA Loop Verification Functionality

The 4-20 mA Loop Verification diagnostic is useful for testing the analog output when errors are suspected. The diagnostic tests the analog loop at 5 points:

- 4 mA
- 12 mA
- 20 mA
- Low alarm level
- High alarm level
SAFETY MESSAGES

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Please read the following safety messages before performing any operation described in this section.

Warnings

⚠️ WARNING

Explosions could result in death or serious injury:
• Verify that the operating atmosphere of the sensor and transmitter is consistent with the appropriate hazardous locations certifications.
• Do not remove the transmitter cover in explosive atmospheres when the circuit is alive.
• Before connecting a HART-based communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.
• Both transmitter covers must be fully engaged to meet explosion-proof requirements.

⚠️ WARNING

Failure to follow safe installation and servicing guidelines could result in death or serious injury:
• Make sure only qualified personnel perform the installation.
• Do not perform any service other than those contained in this manual unless qualified.

Process leaks could result in death or serious injury:
• The electrode compartment may contain line pressure; it must be depressurized before the cover is removed.

⚠️ WARNING

High voltage that may be present on leads could cause electrical shock:
• Avoid contact with leads and terminals.
PROCEDURES

If the output of your Rosemount 8750WA is unstable, first check the wiring and grounding associated with the magnetic flowmeter system. Ensure that the following conditions are met:

- Ground straps are attached to the adjacent flange or ground ring?
- Grounding rings, lining protectors, or grounding electrodes are being used in lined or nonconductive piping?
- Both of the shields attached at both ends?

The causes of unstable transmitter output can usually be traced to extraneous voltages on the measuring electrodes. This “process noise” can arise from several causes including electrochemical reactions between the fluid and the electrode, chemical reactions in the process itself, free ion activity in the fluid, or some other disturbance of the fluid/electrode capacitive layer. In such noisy applications, an analysis of the frequency spectrum reveals process noise that typically becomes significant below 15 Hz.

In some cases, the effects of process noise may be sharply reduced by elevating the coil drive frequency above the 15 Hz region. The Rosemount 8750WA coil drive mode is selectable between the standard 5 Hz and the noise-reducing 37 Hz. See “Coil Drive Frequency” on page 4-33 for instructions on how to change the coil drive mode to 37 Hz.

Auto Zero

To ensure optimum accuracy when using 37 Hz coil drive mode, there is an auto zero function that must be initiated during start-up. The auto zero operation is also discussed in the start-up and configuration sections. When using 37 Hz coil drive mode it is important to zero the system for the specific application and installation.

The auto zero procedure should be performed only under the following conditions:

- With the transmitter and sensor installed in their final positions. This procedure is not applicable on the bench.
- With the transmitter in 37 Hz coil drive mode. Never attempt this procedure with the transmitter in 5 Hz coil drive mode.
- With the sensor full of process fluid at zero flow.

These conditions should cause an output equivalent to zero flow.

Signal Processing

If the 37 Hz coil drive mode has been set, and the output is still unstable, the damping and signal processing function should be used. It is important to set the coil drive mode to 37 Hz first, so the loop response time is not increased.

The 8750WA provides for a very easy and straightforward start-up, and also incorporates the capability to deal with difficult applications that have previously manifested themselves in a noisy output signal. In addition to selecting a higher coil drive frequency (37 Hz vs. 5 Hz) to isolate the flow signal from the process noise, the 8750WA microprocessor can actually scrutinize each input based on three user-defined parameters to reject the noise specific to the application.
This software technique, known as signal processing, "qualifies" individual flow signals based on historic flow information and three user-definable parameters, plus an on/off control. These parameters are:

1. **Number of samples**: The number of samples function sets the amount of time that inputs are collected and used to calculate the average value. Each second is divided into tenths (1/10) with the number of samples equaling the number of 1/10 second increments used to calculate the average. Factory Preset Value = 90 samples.

   For example, a value of:

   - 1 averages the inputs over the past 1/10 second
   - 10 averages the inputs over the past 1 second
   - 100 averages the inputs over the past 10 seconds
   - 125 averages the inputs over the past 12.5 seconds

2. **Maximum Percent Limit**: The tolerance band set up on either side of the running average, referring to percent deviation from the average. Values within the limit are accepted while value outside the limit are scrutinized to determine if they are a noise spike or an actual flow change. Factory Preset Value = 2 percent.

3. **Time Limit**: Forces the output and running average values to the new value of an actual flow rate change that is outside the percent limit boundaries, thereby limiting response time to real flow changes to the time limit value rather than the length of the running average. Factory Preset Value = 2 seconds.

**How Does It Really Work?**

The best way to explain this is with the help of an example, plotting flow rate versus time
x: Input flow signal from sensor.

O: Average flow signals and transmitter output, determined by the “number of samples” parameter.

Tolerance band, determined by the “percent limit” parameter.

- Upper value = average flow + [(percent limit/100) average flow]
- Lower value = average flow – [(percent limit/100) average flow]

1. This scenario is that of a typical non-noisy flow. The input flow signal is within the percent limit tolerance band, therefore qualifying itself as a good input. In this case the new input is added directly into the running average and is passed on as a part of the average value to the output.

2. This signal is outside the tolerance band and therefore is held in memory until the next input can be evaluated. The running average is provided as the output.

3. The previous signal currently held in memory is simply rejected as a noise spike since the next flow input signal is back within the tolerance band. This results in complete rejection of noise spikes rather than allowing them to be “averaged” with the good signals as occurs in the typical analog damping circuits.

4. As in Number 2 above, the input is outside the tolerance band. This first signal is held in memory and compared to the next signal. The next signal is also outside the tolerance band (in the same direction), so the stored value is added to the running average as the next input and the running average begins to slowly approach the new input level.

5. To avoid waiting for the slowly incrementing average value to catch up to the new level input, a shortcut is provided. This is the “time limit” parameter. The user can set this parameter to eliminate the slow ramping of the output toward the new input level.

When Should Signal Processing Be Used?

The Rosemount 8750WA offers three separate functions that can be used in series for improving a noisy output. The first step is to toggle the coil drive to the 37 Hz mode and initialize with an auto zero. If the output is still noisy at this stage, signal processing should be actuated and, if necessary, tuned to match the specific application. Finally, if the signal is still too unstable, the traditional damping function can be used.

NOTE
Failure to complete an Auto Zero will result in a small (<1%) error in the output. While the output level will be offset by the error, the repeatability will not be affected.

HANDHELD COMMUNICATOR

NOTE
Please refer to the Handheld Communicator manual for detailed instructions on the use, features, and full capabilities of the Handheld Communicator.

WARNING
Explosions can result in death or serious injury.
Do not make connections to the serial port or NiCad recharger jack in an explosive atmosphere.
Before connecting the Handheld Communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

CONNECTIONS AND HARDWARE

The HART Field Communicator exchanges information with the transmitter from the control room, the instrument site, or any wiring termination point in the loop. Be sure to install the instruments in the loop in accordance with intrinsically safe or non-incendive field wiring practices. Explosions can result if connections to the serial port or NiCad recharger jack are made in an explosive situation. The Handheld Communicator should be connected in parallel with the transmitter. Use the loop connection ports on the rear panel of the Handheld Communicator (see Figure E-1). The connections are non-polarized.
NOTE
The Handheld Communicator needs a minimum of 250 ohms resistance in the loop to function properly. The Handheld Communicator does not measure loop current directly.
Figure E-3. Connecting the HART Field Communicator with the Optional Load Resistor

BASIC FEATURES

The basic features of the Handheld Communicator include Action Keys, Function Keys, and Alphanumeric and Shift Keys.

Figure E-4. The Handheld Communicator
Action Keys

The Action Keys
As shown in Figure E-4, the action keys are the six blue, white, and black keys located above the alphanumeric keys. The function of each key is described as follows:

ON/OFF Key
Use this key to power the Handheld Communicator. When the communicator is turned on, it searches for a transmitter on the 4–20 mA loop. If a device is not found, the communicator displays the message, “No Device Found at Address O. Poll? YES NO.”

Select “YES” to poll for devices at other address (1-16).
Select “NO” to go to the Main Menu.

If a HART-compatible device is found, the communicator displays the Online Menu with device ID and tag.

Directional Keys
Use these keys to move the cursor up, down, left, or right. The right arrow key also selects menu options, and the left arrow key returns to the previous menu.

Tab Key
Use this key to quickly access important, user-defined options when connected to a HART-compatible device. Pressing the Hot Key turns the Handheld Communicator on and displays the Hot Key Menu. See Customizing the Hot Key Menu in the Handheld Communicator manual for more information.

Function Key
Use the four software-defined function keys, located below the LCD, to perform software functions. On any given menu, the label appearing above a function key indicates the function of that key for the current menu. As you move among menus, different function key labels appear over the four keys. For example, in menus providing access to on-line help, the HELP label may appear above the F1 key. In menus providing access to the Home Menu, the HOME label may appear above the F3 key. Simply press the key to activate the function. See your Handheld Communicator manual for details on specific Function Key definitions.

Alphanumeric and Shift Keys
The Alphanumeric keys perform two functions: the fast selection of menu options and data entry.
Data Entry

Some menus require data entry. Use the Alphanumeric and Shift keys to enter all alphanumeric information into the Handheld Communicator. If you press an Alphanumeric key alone from within an edit menu, the bold character in the center of the key appears. These large characters include the numbers zero through nine, the decimal point (.), and the dash symbol (—).

To enter an alphabetic character, first press the Shift key that corresponds to the position of the letter you want on the alphanumeric key. Then press the alphanumeric key. For example, to enter the letter R, first press the right Shift key, then the “6” key (see Figure E-5 on page E-5). Do not press these keys simultaneously, but one after the other.

Fast Key Feature

The Fast Key feature provides quick on-line access to transmitter variables and functions. Instead of stepping your way through the menu structure using the Action Keys, you can press a Fast Key Sequence to move from the Online Menu to the desired variable or function. On-screen instructions guide you through the rest of the screens.

Fast Key Example

The Fast Key sequences are made up of the series of numbers corresponding to the individual options in each step of the menu structure. For example, from the Online Menu you can change the Date. Following the menu structure, press 1 to reach Device Setup, press 4 for Detailed Setup, press 5 for Device Info, press 5 for Date. The corresponding Fast Key sequence is 1,4,5,5.

Fast Keys are operational only from the Online Menu. If you use them consistently, you will need to return to the Online Menu by pressing HOME (F3) when it is available. If you do not start at the Online Menu, the Fast Keys will not function properly.

Table E-1 is a listing of every on-line function with the corresponding Fast Keys. These codes are applicable only to the transmitter and the Handheld Communicator.

MENUS AND FUNCTIONS

The Handheld Communicator is a menu driven system. Each screen provides a menu of options that can be selected as outlined above, or provides direction for input of data, warnings, messages, or other instructions.
Main Menu

The Main Menu provides the following options:

- **Offline** - The Offline option provides access to offline configuration data and simulation functions.
- **Online** - The Online option checks for a device and if it finds one, brings up the Online Menu.
- **Transfer** - The Transfer option provides access to options for transferring data either from the Handheld Communicator (Memory) to the transmitter (Device) or vice versa. Transfer is used to move off-line data from the Handheld Communicator to the flowmeter, or to retrieve data from a flowmeter for off-line revision.

**NOTE**
Online communication with the flowmeter automatically loads the current flowmeter data to the Handheld Communicator. Changes in on-line data are made active by pressing SEND (F2). The transfer function is used only for off-line data retrieval and sending.

- **Frequency Device** - The Frequency Device option displays the frequency output and corresponding flow output of flow transmitters.
- **Utility** - The Utility option provides access to the contrast control for the Handheld Communicator LCD screen and to the autopoll setting used in multidrop applications.

Once selecting a Main Menu option, the Handheld Communicator provides the information you need to complete the operation. If further details are required, consult the Handheld Communicator manual.

Online Menu

The Online Menu can be selected from the Main Menu as outlined above, or it may appear automatically if the Handheld Communicator is connected to an active loop and can detect an operating flowmeter.

**NOTE**
The Main Menu can be accessed from the Online Menu. Press the left arrow action key to deactivate the on-line communication with the flowmeter and to activate the Main Menu options.

When configuration variables are reset in the on-line mode, the new settings are not activated until the data are sent to the flowmeter. Press SEND (F2) to update the process variables of the flowmeter.

On-line mode is used for direct evaluation of a particular meter, re-configuration, changing parameters, maintenance, and other functions.
Diagnostic Messages

The following is a list of messages used by the Handheld Communicator (HC) and their corresponding descriptions.

Variable parameters within the text of a message are indicated with `<variable parameter>`.

Reference to the name of another message is identified by `[another message]`.

Table E-1. Handheld Communicator Diagnostic Messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add item for ALL device types or only this ONE</td>
<td>Asks the user whether the hot key item being added should be added for all device types or only for the type of device that is connected.</td>
</tr>
<tr>
<td>device type</td>
<td></td>
</tr>
<tr>
<td>Command Not Implemented</td>
<td>The connected device does not support this function.</td>
</tr>
<tr>
<td>Communication Error</td>
<td>Either a device sends back a response indicating that the message it received was unintelligible or the HC cannot understand the response from</td>
</tr>
<tr>
<td>the device.</td>
<td>the device.</td>
</tr>
<tr>
<td>Configuration memory not compatible with connected</td>
<td>The configuration stored in memory is incompatible with the device to which a transfer has been requested.</td>
</tr>
<tr>
<td>device</td>
<td></td>
</tr>
<tr>
<td>Device Busy</td>
<td>The connected device is busy performing another task.</td>
</tr>
<tr>
<td>Device Disconnected</td>
<td>Device fails to respond to a command.</td>
</tr>
<tr>
<td>Device write protected</td>
<td>Device is in write-protect mode. Data can not be written.</td>
</tr>
<tr>
<td>Device write protected – do you still want to shut</td>
<td>Device is in write-protect mode – press YES to turn the HC off and lose the unsent data.</td>
</tr>
<tr>
<td>off?</td>
<td></td>
</tr>
<tr>
<td>Display value of variable on hot key menu?</td>
<td>Asks whether the value of the variable should be displayed adjacent to its label on the hotkey menu if the item being added to the hot key menu</td>
</tr>
<tr>
<td></td>
<td>is a variable.</td>
</tr>
<tr>
<td>Download data from configuration memory to device</td>
<td>Prompts user to press SEND softkey to initiate a memory to device transfer.</td>
</tr>
<tr>
<td>Exceed field width</td>
<td>Indicates that the field width for the current arithmetic variable exceeds the device- specified description edit format</td>
</tr>
<tr>
<td>Exceed precision</td>
<td>Indicates that the precision for the current arithmetic variable exceeds the device- specified description edit format</td>
</tr>
<tr>
<td>Ignore next 50 occurrences of status?</td>
<td>Asked after displaying device status – softkey answer determines whether next 50 occurrences of device status will be ignored or</td>
</tr>
<tr>
<td></td>
<td>displayed</td>
</tr>
<tr>
<td>Illegal character</td>
<td>An invalid character for the variable type was entered.</td>
</tr>
<tr>
<td>Illegal date</td>
<td>The day portion of the date is invalid.</td>
</tr>
<tr>
<td>Illegal month</td>
<td>The month portion of the date is invalid.</td>
</tr>
<tr>
<td>Illegal year</td>
<td>The year portion of the date is invalid.</td>
</tr>
<tr>
<td>Incomplete exponent</td>
<td>The exponent of a scientific notation floating point variable is incomplete.</td>
</tr>
<tr>
<td>Incomplete field</td>
<td>The value entered is not complete for the variable type.</td>
</tr>
<tr>
<td>Looking for a device</td>
<td>Polling for multidropped devices at addresses 1–15</td>
</tr>
<tr>
<td>Mark as read only variable on hot key menu?</td>
<td>Asks whether the user should be allowed to edit the variable from the hot key menu if the item being added to the hot key menu is a variable.</td>
</tr>
<tr>
<td>No device configuration in configuration memory</td>
<td>There is no configuration saved in memory available to re-configure off-line or transfer to a device.</td>
</tr>
<tr>
<td>No Device Found</td>
<td>Poll of address zero fails to find a device, or poll of all addresses fails to find a device if auto-poll is enabled</td>
</tr>
<tr>
<td>No hot key menu available for this device</td>
<td>There is no menu named “hot key” defined in the device description for this device.</td>
</tr>
<tr>
<td>No off-line devices available</td>
<td>There are no device descriptions available to be used to configure a device off-line.</td>
</tr>
<tr>
<td>No simulation devices available</td>
<td>There are no device descriptions available to simulate a device.</td>
</tr>
<tr>
<td>No UPLOAD_VARIABLES in ddl for this device</td>
<td>There is no menu named “upload_variables” defined in the device description for this device – this menu is required for off-line</td>
</tr>
<tr>
<td></td>
<td>configuration.</td>
</tr>
</tbody>
</table>
Table E-1. Handheld Communicator Diagnostic Messages

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Valid Items</td>
<td>The selected menu or edit display contains no valid items.</td>
</tr>
<tr>
<td>OFF KEY DISABLED</td>
<td>Appears when the user attempts to turn the HC off before sending modified data or before completing a method</td>
</tr>
<tr>
<td>On-line device disconnected with unsent data – RETRY or OK to lose data</td>
<td>There is unsent data for a previously connected device. Press RETRY to send data, or press OK to disconnect and lose unsent data.</td>
</tr>
<tr>
<td>Out of memory for hot key configuration – delete unnecessary items</td>
<td>There is no more memory available to store additional hot key items. Unnecessary items should be deleted to make space available.</td>
</tr>
<tr>
<td>Overwrite existing configuration memory</td>
<td>Requests permission to overwrite existing configuration either by a device-to-memory transfer or by an off-line configuration; user answers using the softkeys</td>
</tr>
<tr>
<td>Press OK...</td>
<td>Press the OK softkey – this message usually appears after an error message from the application or as a result of hart communications.</td>
</tr>
<tr>
<td>Restore device value?</td>
<td>The edited value that was sent to a device was not properly implemented. Restoring the device value returns the variable to its original value.</td>
</tr>
<tr>
<td>Save data from device to configuration memory</td>
<td>Prompts user to press SAVE softkey to initiate a device-to-memory transfer</td>
</tr>
<tr>
<td>Saving data to configuration memory</td>
<td>Data is being transferred from a device to configuration memory.</td>
</tr>
<tr>
<td>Sending data to device</td>
<td>Data is being transferred from configuration memory to a device.</td>
</tr>
<tr>
<td>There are write only variables which have not been edited. Please edit them.</td>
<td>There are write-only variables which have not been set by the user. These variables should be set or invalid values may be sent to the device.</td>
</tr>
<tr>
<td>There is unsent data. Send it before shutting off?</td>
<td>Press YES to send unsent data and turn the HC off. Press NO to turn the HC off and lose the unsent data.</td>
</tr>
<tr>
<td>Too few data bytes received</td>
<td>Command returns fewer data bytes than expected as determined by the device description</td>
</tr>
<tr>
<td>Transmitter Fault</td>
<td>Device returns a command response indicating a fault with the connected device</td>
</tr>
<tr>
<td>Units for &lt;variable label&gt; has changed – unit must be sent before editing, or invalid data will be sent</td>
<td>The engineering units for this variable have been edited. Send engineering units to the device before editing this variable.</td>
</tr>
<tr>
<td>Unsent data to on-line device – SEND or LOSE data</td>
<td>There is unsent data for a previously connected device which must be sent or thrown away before connecting to another device.</td>
</tr>
<tr>
<td>Use up/down arrows to change contrast. Press DONE when done.</td>
<td>Gives direction to change the contrast of the HC display</td>
</tr>
<tr>
<td>Value out of range</td>
<td>The user-entered value is either not within the range for the given type and size of variable or not within the min/max specified by the device.</td>
</tr>
<tr>
<td>&lt;message&gt; occurred reading/writing &lt;variable label&gt;</td>
<td>Either a read/write command indicates too few data bytes received, transmitter fault, invalid response code, invalid response command, invalid reply data field, or failed pre- or post-read method; or a response code of any class other than SUCCESS is returned reading a particular variable.</td>
</tr>
<tr>
<td>&lt;variable label&gt; has an unknown value – unit must be sent before editing, or invalid data will be sent</td>
<td>A variable related to this variable has been edited. Send related variable to the device before editing this variable.</td>
</tr>
